

DIGITAL GIGAswitch GS2000 Line Card

Router Management

Part Number: AA-R8REB-TE

September 1998

This manual describes how to configure, monitor, and manage a GIGAswitch GS2000 router.

Revision/Update Information:	This is a revised manual.
Software and Version	GIGAswitch GS2000 Version 3.0

1 Introduction

Overview	1-1
Introduction	1-1
In This Chapter	1-1
Router Features and Protocols	1-2
Understanding Network Interfaces and Ports	1-3
Configuring Routing on VLANs	1-8
Enabling Routing Globally	1-8
Enabling Routing on a VLAN	1-8
Configuring IP on a VLAN Interface	1-8
Starting and Terminating Console Sessions	1-9
Starting and Terminating Local Sessions	1-10
Starting and Terminating Remote Sessions	1-11
Obtaining an IP Address Remotely Using BootP	1-12
Accessing CLI Prompts and the Events Log	1-13
Accessing the Main Prompt	1-13
Accessing the Config Prompt	1-13
Accessing the Monitor Prompt	1-13
Accessing the Events Log	1-14

Using the Command Line Interface	1-15
Using Command Line Editing	1-15
Using Command Line Recall	1-16
Using Command Line Completion	1-16
Disabling and Enabling CLC	1-18
Switching Between Processes	1-19
Entering Commands and Command Shortcuts	1-20
Entering Subsystem Commands	1-20
Displaying CLI Help	1-21
Dynamic Command Configuration	1-22
Using the Web-Based Management Application	1-23
Accessing GS2000 Line Cards Over the Web	1-23
Managing GS2000 Line Cards Over the Web	1-24
Accessing Web Help	1-24
Disabling and Enabling the GS2000 Router Web Server	1-24

2 Configuring VSDs and VLAN Interfaces

Overview	2-1
Introduction	2-1
In This Chapter	2-1
VLAN Secure Domains	2-2
Default VSD	2-2
Routing Between VSDs	2-3
Enabling Routing Globally	2-4
Accessing the VSD Config Prompt	2-5
Creating a VSD	2-5
Modifying a VSD	2-6
Deleting a VSD	2-6
Listing VSD Information	2-6
Exiting the VSD Config Prompt	2-7

3 Configuring and Monitoring the IP Interface

Overview	3-1
Introduction	3-1
In This Chapter	3-1
Enabling IP	3-3
Enabling Routing	3-3
Accessing the IP Configuration Process	3-4
Configuring Addresses	3-5
Adding an IP Address	3-5
Changing an IP Address	3-6

Deleting an IP Address	3-6
Listing an IP Address	3-6
Configuring the Internal IP Address	3-7
Setting the Internal IP Address	3-7
Listing the Internal IP Address	3-7
Deleting the Internal IP Address	3-7
Configuring a Router ID	3-8
Setting the Router ID Default IP Address	3-8
Listing the Router ID Default IP Address	3-8
Deleting the Router ID Default IP Address	3-8
Configuring a Static Route	3-9
Adding a Route	3-9
Changing a Route	3-9
Deleting a Route	3-9
Listing a Route	3-9
Configuring Routing	3-10
Setting the Routing Table Size	3-10
Listing the Routing Table Size	3-10
Configuring Access Controls	3-11
Adding Access Controls	3-11
Deleting Access Controls	3-13
Moving Access Controls	3-13
Listing Access Controls	3-13
Enabling Access Controls	3-13
Configuring Enhanced Proxy ARP	3-15
Overview	3-15
Communicating on a LAN	3-15
Communicating on a Routed LAN	3-15
Communicating on a VLAN	3-16
Configuring Hosts for Enhanced Proxy ARP	3-16
Enabling Enhanced Proxy ARP	3-18
Disabling ARP Routing	3-19
Setting Enhanced Proxy ARP	3-19
Adding Enhanced Proxy ARP Subnets	3-20
Deleting Enhanced Proxy ARP Subnets	3-20
Configuring BootP Forwarding	3-21
Enabling BootP Forwarding	3-21
Disabling BootP Forwarding	3-21
Listing BootP Forwarding	3-21
Configuring a BootP Server	3-22
Adding a BootP Server	3-22
Deleting a BootP Server	3-22
Listing a BootP Server	3-22
Configuring Broadcast Addresses	3-23
Setting Broadcast Addresses	3-23

Listing Broadcast Addresses	3-23
Configuring a Default Gateway	3-24
Setting Default Network Gateway	3-24
Deleting Default Network Gateway	3-24
Configuring a Default Subnet Gateway	3-25
Setting Default Subnet Gateways	3-25
Deleting Default Subnet Gateways	3-25
Configuring Directed Broadcast	3-26
Enabling Directed Broadcast	3-26
Disabling Directed Broadcast	3-26
Configuring a Filtered Route	3-27
Adding a Filter	3-27
Deleting a Filter	3-27
Listing a Filter	3-27
Configuring Path Splitting	3-28
Enabling Path Splitting	3-28
Disabling Path Splitting	3-28
Configuring Reassembly Size	3-29
Setting Reassembly Size	3-29
Listing Reassembly Size	3-29
Configuring UDP Broadcast Forwarding	3-30
Advantages of UDP Forwarding	3-30
Adding a UDP Broadcast Server	3-30
Deleting a UDP Broadcast Server	3-31
Disabling UDP Broadcast Forwarding	3-32
Enabling UDP Broadcast Forwarding	3-32
Examples of Configuring UDP Broadcast Forwarding	3-32
Listing UDP Broadcast Forwarding	3-34
Configuring New Software	3-35
Setting the IP Host-Only Default Network Gateway	3-35
Deleting the IP Host-Only Default Network Gateway	3-35
Setting the IP Host-Only Default Subnet Gateway	3-36
Deleting the IP Host Only Default Subnet Gateway	3-36
Listing IP Protocols	3-36
Monitoring IP	3-37
Monitoring IP Access Control	3-38
Monitoring ICMP Counters	3-39
Monitoring IP Interface Addresses	3-41
Monitoring IP Routing Table Contents	3-42
Monitoring IP Routing Destinations	3-44
Monitoring IP Routing Paths	3-45
Monitoring IP Static Routes	3-47
Monitoring IP Parameters	3-48
Monitoring IP Forwarding Statistics	3-49

4 Configuring and Monitoring the RIP Interface

Overview	4-1
Introduction.....	4-1
In This Chapter	4-1
Configuring RIP.....	4-2
Enabling RIP.....	4-2
Disabling RIP	4-2
RIP Limitations.....	4-3
Enabling RIP Flags.....	4-4
Customizing RIP.....	4-5
Setting RIP Broadcasts	4-6
Converting from RIP to OSPF	4-6
Configuring Accept RIP Routes	4-7
Adding Accept RIP Route	4-7
Deleting Accept RIP Route.....	4-7
Listing Accept RIP Route.....	4-7
Configuring RIP to Override Default Routes	4-8
Configuring RIP to Override Default and Static Routes	4-9
Enabling RIP Override Routes	4-9
Configuring Receiving RIP, Dynamic Nets/Subnets.....	4-11
Enabling RIP Reception on an Interface.....	4-11
Disabling RIP Reception on an Interface	4-11
Enabling Receiving Dynamic Nets.....	4-11
Disabling Receiving Dynamic Nets	4-12
Enabling Receiving Dynamic Subnets	4-12
Disabling Receiving Dynamic Subnets	4-12
Configuring Sending of Routes in RIP	4-13
Enabling Sending Default Routes in RIP	4-13
Disabling Sending Default Routes in RIP	4-13
Enabling Sending Net Routes.....	4-14
Disabling Sending Net Routes	4-14
Enabling Sending Poisoned Reverse Routes	4-14
Disabling Sending Poisoned Reverse Routes	4-15

Preface

Overview

Purpose of This Manual

This manual provides instructions for configuring, monitoring, and managing the DIGITAL GIGAswitch GS2000 line card as a network router.

Intended Audience

This manual is intended for persons who install, configure, and manage computer networks. Although experience with computer networking hardware and software is helpful, you do not need programming experience to configure, monitor, and manage GIGAswitch GS2000 routers.

Organization

This manual is organized as follows:

Section	Description
Chapter 1	Provides general information about the GIGAswitch GS2000 router products and an overview of operational basics that are common to many of the configuration and management tasks described throughout the manual.
Chapter 2	Describes how to configure a VLAN Interface (VI).
Chapter 3	Discusses how to configure and monitor your router using IP protocol.
Chapter 4	Discusses how to configure your router using RIP protocol.
Chapter 5	Discusses how to configure and monitor your router using OSPF protocol.
Chapter 6	Discusses how to configure and monitor your router using ARP protocol.
Chapter 7	Discusses how to configure and monitor your router using BGP4 protocol.
Appendix A	Discusses how to configure and monitor your router using the DIGITAL Trace Facility.
Appendix B	Provides a list of all router CLI commands.
Appendix C	Provides an overview of the counters and the effect of packets on counters as packets flow through the router.

Associated Documents

The following documents provide information relating to the GIGAswitch GS2000 module. For online copies of these documents, refer to the [Online Services](#) section of this manual. To order printed copies, see [How to Order Additional Documentation](#).

Title and Order Number	Description
<i>DIGITAL GIGAswitch GS2000 Line Card Installation</i> EK-DEFGC-IN	Describes the GIGAswitch GS2000 line card, including features, installation, and configuration information.
<i>DIGITAL GIGAswitch GS2000 Line Card Management</i> AA-R8RD*-TE	Provides instructions for configuring, managing, and monitoring a GIGAswitch GS2000 module.
<i>GIGAswitch/ATM System Installation and Service</i> AA-QCV7*-TE	Describes how to install and service the GIGAswitch/ATM system.
<i>GIGAswitch/ATM 5-Slot System Installation and Service</i> EK-DAGWG-IN	Describes how to install and service the GIGAswitch/ATM 5-slot system.
<i>GIGAswitch/FDDI System Installation and Service Guide</i> EK-GGSVA-IN	Describes how to install and service the GIGAswitch/FDDI system.
<i>DIGITAL ATM Modular PHY Cards Installation</i> EK-DAGGM-IN	Provides installation and operating guidelines for installing, verifying, and removing ATM modular PHY cards. Describes cabling and LED information.
<i>clearVISN Installation</i> AA-QX86*-TK	Provides pre- and post-installation information, as well as actual installation procedures for each application.
<i>clearVISN Overview</i> AAQX87*-TK	Provides an overview of clearVISN, an explanation of each application, and descriptions of all concepts necessary to understand and use the application efficiently.
<i>clearVISN User's Guide</i> AAQX88*-TK	Provides information for starting each application, configuring them, and general use information.

Associated Documents

Title and Order Number	Description
<i>DIGITAL VNswitch 900 Series Technical Overview</i> AA-R2LCE-TE	Provides a technical overview of the VNswitch 900 family of high-density switching products.
<i>OPEN DECconnect Applications Guide</i> EC-G6387-42	Provides information to help plan and install networking systems based on DIGITAL OPEN DECconnect System and networking products.
<i>Event Logging System Messages Guide</i> AA-QL2A*-TE	Describes messages logged by the Event Logging System.
<i>Bridge and Extended LAN Reference</i> EK-DEBAM-HR	Describes how bridges are used to create extended local area networks (LANs). The descriptions include the use of bridges in extended LAN configurations, information on LAN interconnections, overall bridge operation, spanning tree, bridge management, and solving bridge-related problems in a network.

Conventions

This manual uses the following conventions:

Convention	Description
Special Type	This special type in examples indicates system output.
Boldface	Boldface type indicates user input.
<i>Boldface Italics</i>	Boldface type in italics indicates variables for which the user or the system supplies a value.
<u>Boldface underscore</u>	Underscored boldface characters indicate the least number of characters you must enter to identify a command. The underscored characters are referred to as command shortcuts. For example, the commands for listing users is <u>list</u> <u>users</u> , and can be entered as <u>l u</u> . Similarly, the command for viewing error statistics is <u>error</u> and can be entered as <u>er</u> .
Return	Indicates that you should press the Return key.
Ctrl/ <i>keystroke</i>	Indicates you should press the key specified by <i>keystroke</i> while holding down the Control key. For example, Ctrl/P indicates you should press the P key while holding down the Control key.

Chapter 1

Introduction

Overview

Introduction

This chapter describes the features of the DIGITAL GIGAswitch GS2000 router, and the basics that are common to many of the tasks described in the following chapters.

In This Chapter

The following topics are covered in this chapter.

Topic	Page
Router Features and Protocols	1-2
Understanding Network Interfaces and Ports	1-3
Configuring Routing on VLANs	1-8
Starting and Terminating Console Sessions	1-9
Accessing CLI Prompts and the Events Log	1-13
Using the Command Line Interface	1-15
Switching Between Processes	1-19
Entering Commands and Command Shortcuts	1-20
Displaying CLI Help	1-21
Dynamic Command Configuration	1-22
Using the Web-Based Management Application	1-23

These topics are common to most of the procedures described throughout this manual and are frequently referenced by those procedures.

Router Features and Protocols

The GIGAswitch GS2000 router is available as either a preloaded factory-installed feature or as a software upgrade for existing GS2000 line cards.

The GIGAswitch GS2000 line card is designed for LAN backbones and high-performance workgroups supporting bridging, VLAN and routing capabilities.

The GIGAswitch GS2000 router option provides the following features:

- Supports level 3 IP routing while maintaining unicast bridging performance
- Provides a Web management interface
- Supports dynamic IP interface management
- Supports IP routing for a maximum of 32 VLANs
- Routing between ATM emulated LANs
- Eliminates the need for expensive external routers
- Supports multiple filtering options, including filtering based on network, host address, or application (for example, File Transfer Protocol [FTP])

The GIGAswitch GS2000 router supports the following routing protocols:

- Routing Information Protocol (RIP)
- Open Shortest Path First (OSPF)
- Border Gateway Protocol (BGP)

Understanding Network Interfaces and Ports

GIGAswitch GS2000 architectural design applies different definitions to the terms *interface* and *port*. The design further distinguishes among three types of interface: physical, logical, and (VLAN Secure Domain) VSD.

Physical Interface

A physical interface is the physical point on the line card to which a network transmission medium (cable or fiber, for example) is connected. Physical interfaces on the line card include FDDI and ATM. FDDI and ATM physical interfaces are identified by a unique number adjacent to each interface on the line card's front panel. [Figure 1-1](#) shows the physical interfaces on the front panel of a GIGAswitch GS2000 line card.

Understanding Network Interfaces and Ports

Figure 1-1: Physical Interfaces

LKG-10696-97WI

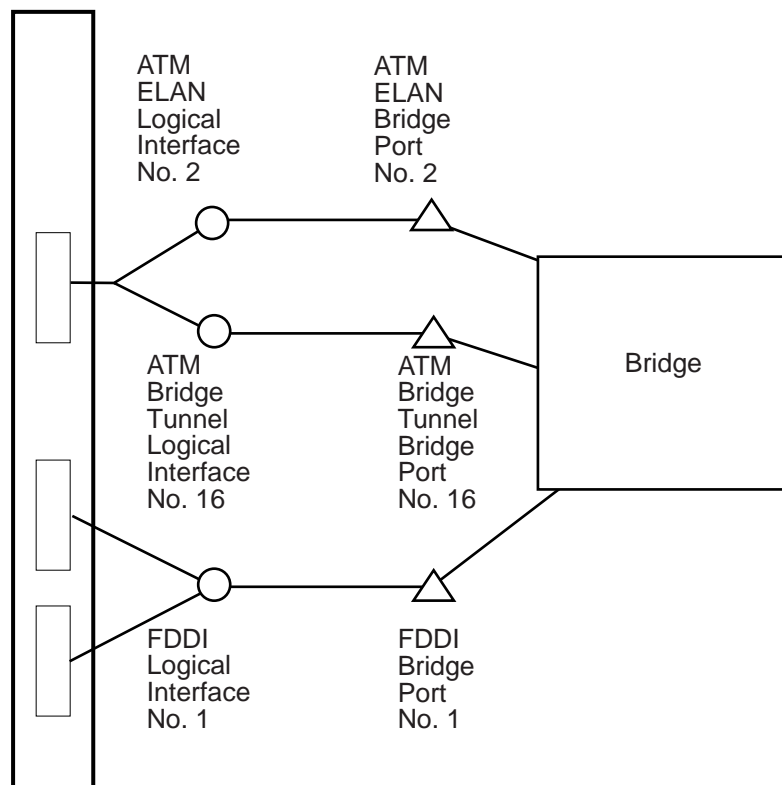

Logical Interface

A logical interface is an abstract connection point between a physical interface and a bridge Port. The FDDI physical interface is associated with one logical interface. An ATM physical interface is associated with 1 to 16 logical interfaces, each of which is the connection point to either an ATM emulated LAN (ELAN), or an ATM bridge tunnel. Each logical interface is identified by a unique number. [Figure 1-2](#) shows examples of logical interfaces on a GIGAswitch GS2000 line card.

Bridge Port

A bridge port is an abstract connection point to a transparent bridge. The transparent bridge forwards data to, or receives data from, another bridge port, based on the MAC address associated with the data. Each bridge port is identified by a unique number. The port number has a value that is the same as the logical interface with which it is associated. [Figure 1-2](#) shows a GIGAswitch GS2000 line card that includes one port from the FDDI interface, one port from an ELAN interface, and one port from an ATM bridge tunnel interface.

Figure 1-2: Logical Interfaces and Bridge Ports

LKG-10698-97WI

Understanding Network Interfaces and Ports

Interface and Bridge Port Numbering Scheme

Each physical and logical interface is assigned an interface number. For FDDI interfaces, the physical interface number printed on the line card's front panel is the same as the logical interface number. For an ATM interface, the physical interface number (2) is the same as only one of the sixteen ATM logical interface numbers (2 through 17).

A bridge port number has the same value as that of its associated logical interface. For example, FDDI logical interface number 1 is associated with FDDI bridge port number 1. Similarly, ATM logical interface number 15 has a bridge port number of 15, and so on. Refer to [Figure 1-2](#) for an example of interface and port numbering schemes.

VLANs and VLAN Secure Domains

A VLAN is a group of bridge ports logically linked to define a LAN on one or more GIGAswitch GS2000 line cards. This network configuration scheme enables you to configure a set of devices so they logically appear to be on the same LAN segment, although they may be physically on different segments.

A VSD is a logical set of one or more VLANs that operates with one spanning tree. A VLAN consists of a set of distinct bridge ports. Each set of bridge ports is isolated from other ports on the same line card by blocking all unicast and multicast traffic between VSDs. The GIGAswitch GS2000 line card presently supports one VLAN per VSD, but the VSD concept provides for expanded support of multiple VLANs within a single VSD.

VLAN Logical Interface

A VLAN logical interface is an abstract connection between a VLAN and a router, enabling you to connect multiple VLANs through the router. [Figure 1-3](#) shows examples of VLAN logical interfaces on a GIGAswitch GS2000 line card.

Figure 1-3: VLAN Logical Interfaces

LKG-10699-97WI

Configuring Routing on VLANs

To configure the GIGAswitch GS2000 router to operate on a VLAN, you enable routing globally, then enable routing on a VLAN, and then configure IP to run on a VLAN. The following sections provide an overview on how to configure routing on VLANs.

Enabling Routing Globally

To operate a GIGAswitch GS2000 router on a VLAN, you must first enable routing globally. The router is initially configured with routing globally disabled. When you issue the **enable router** command and answer **yes** to the prompt, the router automatically invokes a restart. Upon completing the **enable router** command, the router firmware adds an associated 32 routing interfaces called VLAN Interfaces (VIs).

Enabling Routing on a VLAN

Once the router is enabled, 32 VIs are created on the router. You can then select any one of the 32 VIs and associate that VI with a VLAN. Each VI is associated with one VLAN. The default is to associate a newly created VLAN with the first available VI.

IP routing protocols for the GIGAswitch GS2000 line card operate only on VLAN interfaces, but they operate the same as they do on all other LAN interfaces, such as FDDI or ATM. VLAN Interfaces, just like other LAN interfaces, have unique network interface numbers which are automatically generated. A GIGAswitch GS2000 line card, for example with 17 interfaces, assigns the 32 VI as interfaces 18 through 49.

Configuring IP on a VLAN Interface

To configure IP to run on a VLAN interface, you only need to specify the interface number that corresponds to the VI. You can configure IP on a VI although the VI is not associated with a VLAN, however, IP is not active until you associate the VI with a VLAN.

When specifying the network interface, you supply an IP address, subnet mask, and the IP protocols you want to enable. The IP address and subnet mask you specify for a VI must be valid for the IP subnet connected to the bridge ports in the VI's associated VSD.

Starting and Terminating Console Sessions

The console is the terminal from which you configure, monitor, and manage a GIGAswitch GS2000 line card. The terminal operates as either a local or a remote console. Local consoles access only those line cards where the console is attached to the console port of a GIGAswitch GS2000 line card. Remote consoles can access line cards located on the network.

NOTE

If you do not have a BootP server, a local console is required for initial configuration of the GS2000 software, and may be required when upgrading to a new version. A remote console can be used after initial configuration, if either IP routing or TCP/IP Host Services is enabled.

A maximum of two remote consoles can establish a session with a line card at the same time.

Consoles are connected to either a GIGAswitch GS2000 console port or any GIGAswitch GS2000 line card network interface (FDDI, ATM, ELAN, or ATM Bridge Tunnel). Whether the session is a local or a remote session depends on the type of port through which you are establishing the connection. [Table 1-1](#) lists the connection methods available, and the type of session (local or remote) you establish through the connection.

Table 1-1: Console Connection Methods

Method of Connection	Type of Session Established
Through console port	Local Console session
Through a network server using Telnet	Remote Console session

All methods of connection provide in-band management.

The following instructions assume your terminal is already connected and configured for access to GIGAswitch GS2000 line cards. Refer to the *DIGITAL GIGAswitch GS2000 Installation* guide for information about how to connect a console to a console port. Refer to the *DIGITAL GIGAswitch GS2000 Line Card Management* guide for information on how to configure the GIGAswitch GS2000 for Telnet connections.

Starting and Terminating Console Sessions

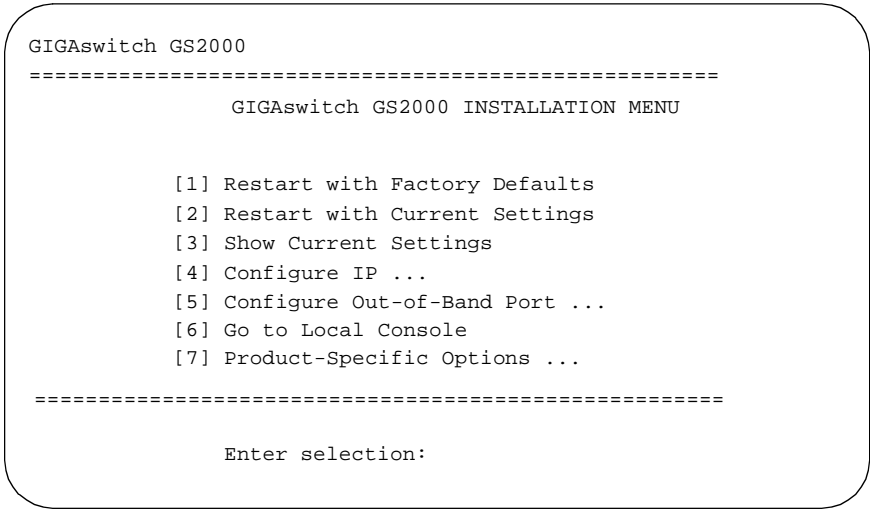

Starting and Terminating Local Sessions

To start a local console session through a console port, perform the following steps:

Step	Action
1	Turn on the power to your terminal. A menu similar to the one shown in Figure 1-4 is displayed.
2	Enter 6 (Go to Local Console) and press Return. A Local Console session is established and the Main Process prompt (Main>) is displayed. NOTE: If ID and password prompting is enabled by the line card administrator, you are prompted for your ID and password before the Main Process prompt is displayed.

To terminate a console session, enter **logout** at the Main prompt (Main>) and press Return.

Figure 1-4: GIGAswitch GS2000 Installation Menu

NOTE

Option 5 of the GIGAswitch GS2000 Installation Menu, Configure Out-of-Band Port, is not applicable. You can manage the GS2000 remotely by using Telnet. See [Starting and Terminating Remote Sessions](#) on page 111 for more information.

Starting and Terminating Console Sessions

Starting and Terminating Remote Sessions

Remote console sessions can be established only after configuring the appropriate network connections. You can start and terminate remote sessions by using Telnet through a console session, as described in the following section. Also refer to the *DIGITAL GIGAswitch GS2000 Line Card Management* guide for additional information about how to do so.

To start a console session through a network server, perform the following steps:

Step	Action
1	Access the operating system prompt from your terminal.
2	Enter telnet ip-address , where <i>ip-address</i> is the address for the line card you want to access, if attempting to do so through a line card's network interface (FDDI or ATM).
3	Press Return. The Main Process prompt (Main>) is displayed. <u>Note:</u> If ID and password prompting is enabled by the line card administrator, you are prompted for your ID and password before the Main Process prompt is displayed.

To terminate a console session, enter **Ctrl/C** or **logout** at the Main Process prompt (Main>) and press Return. The operating system prompt is displayed.

Starting and Terminating Console Sessions

Obtaining an IP Address Remotely Using BootP

If you have a BootP or DHCP server configured on your network and your GIGAswitch GS2000 is not assigned an IP address, the line card takes advantage of BootP client software to automatically obtain an IP address for itself during power up or restart. Refer to the vendor's BootP or DHCP documentation for configuration information.

NOTE

The BootP client conforms to RFC 1542, which does not use the DHCP message type in the BootP request. Therefore, DHCP servers that conform to RFC 1534 must be configured to support BootP requests.

A GIGAswitch GS2000 (as a BootP client) that does not have an IP address assigned, sends out a BootP (broadcast) request to a BootP or DHCP server. When the server replies with an IP address, the GIGAswitch GS2000 configures the IP address for HST dynamically. This IP address is stored permanently, so power-cycling the line card does not have any impact on the IP address. To change the IP address, you use the configuration menu.

An IP address is required for the GIGAswitch GS2000 if you plan to manage it using an SNMP tool such as clearVISN.

Accessing CLI Prompts and the Events Log

The initial steps for most of the tasks discussed throughout this document involve accessing the command line interface (CLI) prompts (Main, Config, and Monitor) and the events log. Instructions about how to access the prompts are presented here, rather than repeating them for each task covered later in this manual.

Only one user at a time can access the Config or Monitor prompts, or the event log. If another user attempts to access the same prompt you are currently using, the message `Current Process has been Redirected` is displayed and you are returned to the previous prompt you were using. If, for example, you access the Monitor prompt from the Main prompt and another user then accesses the Monitor prompt, the message `Current Process has been Redirected` is displayed and you are returned to the Main prompt. The user who accessed the prompt you were using receives all redirected output from those tasks you initiated, but that did not yet display on your screen. Any task you initiated is completed, unless the user to whom the output is redirected cancels it.

Accessing the Main Prompt

The Main process is automatically initiated, and the Main process prompt (`Main>`) is displayed, each time you start a console session.

Accessing the Config Prompt

To access the Config process, perform the following steps:

Step	Action
1	At the Main process prompt (<code>Main></code>) enter Config .
2	Press Return. The Config prompt (<code>Config></code>) is displayed.
3	If the prompt is not displayed, press Return a second time.

Accessing the Monitor Prompt

To access the Monitor process, perform the following steps:

Step	Action
1	At the Main process prompt (<code>Main></code>) enter Monitor .
2	Press Return. The Monitor prompt (<code>Monitor></code>) is displayed.
3	If the prompt is not displayed, press Return a second time.

Accessing CLI Prompts and the Events Log

Accessing the Events Log

To access the Events Log, perform the following steps:

Step	Action
1	At the Main process prompt (Main>) enter Events .
2	Press Return. Output from the Event Log is displayed, if it is configured to do so. (No prompt is displayed.) Refer to the <i>DIGITAL GIGAswitch GS2000 Line Card Management</i> guide for information about configuring and monitoring the Event Logging System.

Using the Command Line Interface

The command line interface provides features that make entering commands to the line card quicker and easier. You can:

- Edit commands on the command line
- Recall commands previously entered
- Complete partially entered commands automatically

For information on using command shortcuts, see *Entering Commands and Command Shortcuts* on page 1-20.

Using Command Line Editing

Command line editing allows you to correct or change your entries on the command line. [Table 1-2](#) lists the command line editing keys.

Table 1-2: Command Line Editing Keys

To...	Enter...
Move left one character	ctrl/B or left arrow
Move right one character	Ctrl/F or right arrow
Restore the line as it was before editing	Ctrl/R
Delete the character to the left	Ctrl/H, Delete or Backspace
Delete the character at the cursor	Ctrl/D
Move to the beginning of the line	Ctrl/A
Move to the end of the line	Ctrl/E
Delete to the end of the line	Ctrl/K
Transposes the characters at the cursor and the character to the left	Ctrl/T

Using Command Line Recall

Command line recall stores up to 10 previously entered commands in one session. You can redisplay those commands on the command line, one at a time, to re-enter them or edit and then re-enter them. [Table 1-3](#) lists the command line recall keys.

Table 1-3: Command Line Recall Keys

To...	Enter...
Display the command that you entered after the currently displayed command	Ctrl/U or up arrow
Display the command that you entered before the currently displayed command	Ctrl/N or down arrow

Using Command Line Completion

With command line completion (CLC), you can enter part of a command then press the space bar for automatic completion of the command. Depending on the ambiguity of your entry, CLC completes as much of the command as possible, or displays a list of options.

Examples: The following examples show how CLC works. The underscore (`_`) in these examples represents pressing the space bar. The vertical bar (`|`) represents the cursor position after command line completion.

Table 1-4: Command Line Completion Conditions

Command Line Entry	Resulting Command Line Completion
MAIN>_	There are 14 available options... CONFIG DIVER . . . TELNET
	MAIN>
IP Config>l_	IP Config>list
IP Config>add ac_	IP Config>add acce

Using the Command Line Interface

Command Line Entry	Resulting Command Line Completion
IP Config> c _	There are 2 available options... CHANGE CONFIG IP Config>c
IP Config> add a _	There are 3 available options... ACCEPT-RIP-ROUTE ACCESS-CONTROL ADDRESS IP Config>add a
IP Config> add _	There are 7 available options... ACCEPT-RIP-ROUTE ACCESS-CONTROL ADDRESS BOOTP-SERVER BROADCAST-FORWARDER ENHANCED-PROXY-ARP FILTER ROUTE IP Config>add

CLC ignores spaces entered after the last word of a command, treating the space as a normal space. CLC does not respond to unrecognized entries.

Using the Command Line Interface

Disabling and Enabling CLC

Command line completion is initially enabled by default and can be disabled. You can change the setting for new sessions dynamically from the `Config>` process, or you can change your current session from the `Monitor>` process. Changing settings using either method affects all processes.

To change the setting for new sessions, use the following commands:

```
Config>enable command-line-completion  
Config>disable command-line-completion
```

To change the setting for current sessions, use the following commands:

```
Monitor>enable command-line-completion  
Monitor>disable command-line-completion
```

To determine the state of CLC for new sessions and the current session, perform the following commands:

```
Config>list all  
Monitor>list all
```

Switching Between Processes

You can switch from one process to another without exiting. For example, you can switch from the `Monitor>` process to the `Config>` process by entering:

```
Monitor> config
```

However, to exit from any process, enter **exit** or **Ctrl/P**.

The Ctrl/P key combination is called the intercept character. You can change the intercept character, if necessary.

Changing the Intercept Character

The intercept character is used to return to the Main process from another process. The default intercept character is Ctrl/P. To change the intercept character, perform the following steps:

Step	Action
1	At the Main prompt, enter intercept .
2	Press Return. The following message is displayed. <code>Enter character []:</code>
3	Enter the desired character (x , for example).
4	Press Return. The intercept character is changed.

Example

```
Main>intercept x
```

Entering Commands and Command Shortcuts

You perform tasks by entering commands at a process prompt. For example, if you want to view a list of all users, you must access the Config process and enter **list users** at the Config process prompt. Similarly, if you want to view error statistics for the network, you access the Monitor process and enter **error** at the Monitor prompt.

Most tasks can also be initiated by entering only part of a command as a shortcut, rather than entering the entire command. In the following chapters, that portion of the command that can be entered as a shortcut is indicated with an underscore. For example, the commands for listing users is shown as **list users**, and can be entered at the Config prompt as **l u**. Similarly, the command for viewing error statistics is shown as **error** and can be entered at the Monitor prompt as **err**.

You can obtain help at any of the process (Main, Config, or Monitor) prompts and at any of the lower-level prompts (**IP Config>**, **VSD Config>**, and so on) by typing **?**, followed by Return. Refer to [Displaying CLI Help](#) for a detailed description of displaying shortcuts using help.

Entering Subsystem Commands

Although the CLI is tree-structured, you can bypass that structure when you are familiar with the commands for various subsystems. For example, if you are at the Monitor (**Monitor>**) prompt, you can check ARP hardware configuration information without going first to the ARP console prompt (**ARP>**). At the Monitor prompt, enter:

```
Monitor> arp h
```

The monitor prompt remains, but the data displayed is from the ARP console subsystem. This shortcut allows you to execute a single command for a subsystem without leaving the Monitor or Config prompt.

Entering Commands and Command Shortcuts

You can also use this shortcut to enter commands for other subsystems without leaving the current subsystem. For example, while at the `IP Config>` prompt, you can find out about ARP contents by entering:

```
IP Config> config arp list all
```

Note

You cannot use this shortcut to execute a Config command while at the Monitor prompt. Nor can you execute a Monitor command while at the Config prompt. In either of these cases you must enter the Config or Monitor component first, then enter the desired command.

Displaying CLI Help

You can obtain help at the Main, Config, or Monitor prompts and at any of the lower-level prompts (`IP Config>`, `OSPF Config>`, and so on) by typing `?`, followed by Return. Help is displayed as a list of the commands available at that prompt level. Use `? (help)` to list the commands that are available from the current prompt level. You can also enter a `?` after a specific command name to list its options.

Dynamic Command Configuration

The GIGAswitch GS2000 router supports some dynamic configuration commands. However, only a subset of commands for the GIGAswitch GS2000 are dynamic. A dynamic command takes effect immediately and does not require you to restart a router after the command is issued.

The GIGAswitch GS2000 provides full support of dynamic command configuration for IP and RIP protocols and no support for OSPF protocol.

The following limitation applies to dynamic command configuration:

Once IP is enabled, it cannot be dynamically disabled. However, you can remove all the IP addresses or disable all the VIs.

Using the Web-Based Management Application

The GS2000 line card, with V3.0 firmware, includes a built-in web server and management application that allow you to configure and monitor the line card over the Internet. You can use either of the following web browsers:

- Netscape V4.0
- Internet Explorer V4.0

Accessing GS2000 Line Cards Over the Web

To access a line card, open your browser and enter the line card's IP address in the Location field.

NOTE

For web access, you must first assign an IP address to the line card using the CLI. See the *DIGITAL GIGAswitch GS2000 Line Card Management* guide for the procedure.

The management application displays with the Management window on the right, and an application tree on the left. The Management window is the first (or top) item in the java application tree, which expands with a menu of parameters that you can use to manage the line card. For browsers with java disabled, select non-java to view the application tree.

Using the Web-Based Management Application

Managing GS2000 Line Cards Over the Web

Once you access the GS2000 router web-based management application, you can configure the line card with a limited set of system, interface, bridge, and IP router parameters. Choose a parameter from the application tree, and enter the appropriate information in the related application window. For parameters that you cannot configure with the web-based management application, the application tree contains a Telnet feature that allows you to access the CLI.

Accessing Web Help

The GS2000 router web-based management application includes a comprehensive help system that provides information related to the application windows, plus links to online documentation. To conserve line card memory, the web help is made available at our Web site. Refer to [Online Services on page xx](#) for the Uniform Resource Locator (URL). It is recommended that you install the help on a web server.

Help is accessible from any application window by clicking the Help button. You can access an overview of the help system from the Management window, or by clicking the Main Contents button in any help window.

Disabling and Enabling the GS2000 Router Web Server

The web server in the GS2000 router is enabled by default. However, you have the option of disabling the server by entering a single command using the CLI. Disabling the server disables the GS2000 router web-based management application.

To disable the web server, enter the following command:

```
HTTP Config> disable
```

To enable the web server, enter the following command:

```
HTTP Config> enable
```

Chapter 2

Configuring VSDs and VLAN Interfaces

Overview

Introduction

A VLAN is a group of bridge ports logically linked to define a LAN on one or more modules or line cards. This network configuration scheme enables you to configure a set of devices so they logically appear to be on the same LAN segment, although they may be physically on different segments. You can create a maximum of 32 VLANs per DIGITAL GIGAswitch GS2000 line card.

This chapter focuses on configuring VLAN Secure Domains (VSDs) for routing. For a detailed description of how to create, modify, and delete VSDs, refer to the *DIGITAL GIGAswitch GS2000 Line Card Management* manual.

In This Chapter

This chapter discusses the following topics

Topic	Page
VLAN Secure Domains	2-2
Routing Between VSDs	2-3

VLAN Secure Domains

A VLAN Secure Domain (VSD) is a logical set of one or more VLANs that operates with one spanning tree. The resulting configuration is a set of distinct bridge ports isolated from other ports on the same line card by blocking all unicast and multicast traffic between VSDs.

Default VSD

All bridge ports on a GIGAswitch GS2000 line card are, by default, members of a default VSD. The default VSD is numbered VSD 1 and is assigned the name “DEFAULT.”

When more than one GIGAswitch GS2000 line card is resident in a DIGITAL GIGAswitch system, all ports on all GIGAswitch GS2000 line cards are, by default, members of the same (default) VSD. Ports that are members of the default VSD operate as a traditional bridge without VLANs. When you create a new VSD as described in the [Routing Between VSDs](#) section, the ports you assign as members of the new VSD are removed from the default VSD. Conversely, when a VSD is deleted, all ports that were members of the VSD automatically become members of the default VSD.

Routing Between VSDs

Routing on a GIGAswitch GS2000 is accomplished using VSDs. Since there is currently only one VLAN in each VSD, these terms are identical and can be used interchangeably. The **routing interface** qualifier associated with the **create vsd** command establishes routing on a VI. The routing interface qualifier is available after routing is globally enabled.

[Table 2-1](#) provides a list of VSD commands with the router qualifiers.

Table 2-1: Create VSD Command Options

VSD Command	Parameters	Description
VSD Config> create vsd	[name <i>vsd-name</i>] [ports <i>port-list</i>] [routing-interface] (<i>any</i> <i>interface-number</i>)	Enables routing on a VSD as it is created. The <i>any</i> keyword associates the next available VSD with the newly created VLAN interface.
VSD Config> modify vsd (<i>vsd-number</i> / <i>vsd-name</i>)	[name <i>new-name</i>] [ports <i>port-list</i>] [routing-interface] (<i>any</i> <i>none</i> <i>interface-number</i>)	Enables or disables routing on an existing VSD. The <i>none</i> keyword disassociates the VSD from any VLAN interface.
VSD Config> delete vsd (<i>vsd-number</i> / <i>vsd-name</i>)		Associated VSD ports return to the default VSD, the VSD name is deleted. Disassociates the VSD from the VLAN Interface (VI), but does not delete the VI.
VSD Config> list vsd (<i>vsd-number</i> / <i>vsd-name</i>) list all		Displays the specified VSD number, name, ports, and the network interface number.
* Not applicable, use default value.		

Routing Between VSDs

Enabling Routing Globally

To operate a GIGAswitch GS2000 router on a VLAN, you must first enable routing globally. The router is initially configured with routing globally disabled. Issuing the *enable router* command and answering **yes** to the prompt, the router automatically invokes a restart. To enable routing globally, perform the following steps:

Step	Action
1	At the Main process prompt (Main>), enter: <u>config</u>
2	Press Return. The Config prompt (Config>) is displayed.
3	At the Config> prompt, enter: <u>enable routing</u>
4	Press Return. The following is displayed and requires action: Enable RIP listening after restart [No]? Default Gateway [0.0.0.0]? When the box reboots the MAC address assigned to the interface associated with the HST address may be different from the one currently being used. Therefore you may need to flush the ARP cache on your host before you can reconnect via Telnet. ***WARNING*** This will invoke an automatic RESTART Are you sure you want to do this (Yes or No): Yes System Restart ... After the system is restarted, the GIGAswitch GS2000 Installation Menu appears. Routing on your GIGAswitch GS2000 is now enabled.

Accessing the VSD Config Prompt

To configure a VI for IP routing, you must access the VSD `Config>` prompt with routing enabled. To access the VSD prompt with routing enabled, perform the following steps:

Step	Action
1	At the <code>Main></code> prompt, enter: config
2	Press Return. The Config prompt (<code>Config></code>) is displayed.
3	At the <code>Config></code> prompt, enter: v lans
4	Press Return. The VSD Config prompt (<code>VSD Config></code>) is displayed.

Creating a VSD

Once you have enabled routing and entered the VSD Config process, you are now ready to create a VSD. The following example creates a VSD named **test**, assigning bridge ports **1-12** and assigning the next available VLAN Interface (VI) using the **any** keyword.

Step	Action
1	At the <code>VSD Config></code> prompt, enter: create ysd
2	Press Return. The following is displayed: VSD Name: [] test Bridge Ports (range 1-24): []? 1-12 VNbus tag (range 66-128): [] <Return> Routing over VI (none, any, or one of 27-56): [any]? VSD 2 created.
3	At the <code>VSD Config></code> prompt, enter: exit
4	Press Return. The <code>Config></code> prompt is displayed and you have successfully created a VI.

NOTE

The Routing over VI (none, any, or one of 27-56): [any]? parameter is only displayed when routing is enabled.

Routing Between VSDs

Modifying a VSD

You can modify a VSD name or list of assigned ports. To modify a VSD name, perform the following steps:

Step	Action
1	To modify a VSD name, at the VSD Config> prompt, enter: <u>modify</u> <u>ysd</u> <i>number</i> <u>name</u> <i>new-name</i>
2	To modify the ports assigned to a VSD, at the VSD Config> prompt, enter: <u>modify</u> <u>ysd</u> <i>number</i> <u>ports</u> <i>new-port-list</i>
3	To modify the VSD using more than one command option (for example, the name and port list enter: <u>modify</u> <u>ysd</u> <i>number</i> <u>name</u> <i>new-name</i> <u>ports</u> <i>new-port-list</i>
4	Press Return. The VSD is modified according to the changes you entered.

Deleting a VSD

To delete a VSD, perform the following steps:

Step	Action
1	At the VSD Config> prompt, enter: <u>delete</u> <u>ysd</u> <i>number</i> or <u>delete</u> <u>ysd</u> <i>name</i>
2	Press Return. The VSD is deleted.

Listing VSD Information

To list information about VSDs that are created, perform the following steps:

Step	Action
1	At the VSD Config> prompt, enter: <u>list</u> <u>all</u>
2	Press Return. All the VSDs and their associated number, name, ports, and IFC are displayed.

Exiting the VSD Config Prompt

You exit the VSD Config prompt to return to the router configuration prompt. For example, to return to the router configuration prompt (`Config>`) from the VSD `Config>` prompt, enter **`exit`** and then press Return.

Chapter 3

Configuring and Monitoring the IP Interface

Overview

Introduction

This chapter provides instructions on how to configure and monitor the IP protocol for a GIGAswitch GS2000 logical interface.

In This Chapter

This chapter discusses the following topics:

Topic	Page
Enabling IP	3-3
Configuring Addresses	3-5
Configuring the Internal IP Address	3-7
Configuring a Router ID	3-8
Configuring a Static Route	3-9
Configuring Routing	3-10
Configuring Access Controls	3-11
Configuring Enhanced Proxy ARP	3-15
Configuring BootP Forwarding	3-21
Configuring a BootP Server	3-22
Configuring Broadcast Addresses	3-23
Configuring a Default Gateway	3-24
Configuring a Default Subnet Gateway	3-25

Topic	Page
Configuring Directed Broadcast	3-26
Configuring a Filtered Route	3-27
Configuring Path Splitting	3-28
Configuring Reassembly Size	3-29
Configuring UDP Broadcast Forwarding	3-30
Configuring New Software	3-35
Monitoring IP	3-37
Monitoring IP Access Control	3-38
Monitoring IP Interface Addresses	3-41
Monitoring IP Routing Table Contents	3-42
Monitoring IP Routing Destinations	3-44
Monitoring IP Routing Paths	3-45
Monitoring IP Static Routes	3-47
Monitoring IP Parameters	3-48
Monitoring IP Forwarding Statistics	3-49

Enabling IP

To enable the internet protocol (IP), you must start a console session, access the Main and Configuration processes (as described in Chapter 1), enable routing (which initiates a restart), access the IP Configuration process, then assign an IP address.

Once you start a console session, the Main process is automatically initiated, and the Main prompt (Main>) is displayed.

Enabling Routing

To access and configure IP, you must first enable routing. To enable routing, perform the following steps:

Step	Action
1	At the Main prompt (Main>), enter: config
2	Press Return. The Config prompt (Config>) is displayed.
3	At the Config> prompt, enter: enable routing
4	Press Return. The following is displayed and requires action: Enable RIP listening after restart [No]? Default Gateway 0.0.0.0? After restart, the MAC address assigned to the interface associated with the HST IP address may be different from the one currently being used. Therefore you may need to flush the ARP cache on your host before you can reconnect via Telnet. ***WARNING*** This will invoke an automatic RESTART Are you sure you want to do this (Yes or [No]): Yes System Restart ... After the system is restarted, the GIGAswitch GS2000 Installation Menu appears. Routing on your GIGAswitch GS2000 is now enabled.

Enabling IP

Accessing the IP Configuration Process

To access the IP Configuration process, perform the following steps:

Step	Action
1	At the <code>Main></code> prompt, enter: <code>config</code>
2	Press Return. The <code>Config></code> prompt is displayed.
3	At the <code>Config></code> prompt, enter: <code>ip</code>
4	Press Return. The <code>IP Config></code> prompt is displayed.

Configuring Addresses

Adding an IP Address

To enable the IP protocol, you must assign at least one IP address to any of the router's VLAN interfaces (VI). Use the **add address** command to assign an IP address to a VI. To add interface addresses, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>add address interface-number ip-address address-mask</code>
2	Press Return. The specified IP address is assigned to the specified VIs.

A VI does not receive or transmit IP packets until it has at least one IP address and has an associated VLAN.

You must specify an IP address together with its subnet mask. For example, if the address is on a class B network, using the third byte for subnetting, the mask is 255.255.255.0. Use the `list devices` command to obtain the appropriate interface-number.

Example: `IP Config> add address 31 128.185.123.22 255.255.255.0`

Multiple IP addresses can be added to the same interface as long as the restrictions listed below are met.

Restrictions

The limitations to assigning an IP address to subnets are:

- Only one address is allowed in each subnet.
- Each subnet can appear on only one interface.

Configuring Addresses

Changing an IP Address

To change an IP address, at the `IP Config>` prompt, enter:

change address *old-ip-address new-ip-address new-subnet-mask*

Deleting an IP Address

To delete an IP address, at the `IP Config>` prompt, enter:

delete address *ip-address*

Listing an IP Address

To list an IP address, at the `IP Config>` prompt, enter:

list address

This command prints the IP interface addresses that were assigned to the router, along with their configured broadcast formats.

Configuring the Internal IP Address

Setting the Internal IP Address

This command sets the internal IP address that belongs to the router as a whole, and not any particular interface. It is recommended that you set the internal IP address because ping, traceroute and tftp packets sent by the router use the internal IP address. To set the internal IP address, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set <u>i</u>nternal-ip-address <i>ip-address</i></code>
2	Press Return.

This address is always reachable regardless of the state of the interfaces. When the internal IP address is not configured, the default router IP address is the router ID. If the router ID is not configured, the router uses the first IP address in the router's configuration.

Example: `IP Config> set internal-ip-address 142.82.10.1`

Listing the Internal IP Address

To list the internal IP address, at the `IP Config>` prompt, enter:

`list address`

Deleting the Internal IP Address

To delete the internal IP address, at the `IP Config>` prompt, enter:

`set internal-ip-address 0.0.0.0`

Configuring a Router ID

Setting the Router ID Default IP Address

This command sets the default IP address used by the router when sourcing various kinds of IP traffic. To set the router ID, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set router-id ip-address</code>
2	Press Return.

This address is of particular importance. For example, the source address in pings, traceroute, and TFTP packets sent by the router are set to the router ID. In addition, the OSPF router ID is set to the configured router ID.

The router ID must match one of the configured IP interface addresses of the router. If not, it is ignored. When ignored, or just not configured, the default IP address of the router (and its OSPF router ID) is set to the first IP address in the router's configuration.

NOTE

Configuring a router ID may cause the router's OSPF router ID to change. If this happens, link state advertisements originated by the router before the router ID change persist until they age out (possibly as long as 30 minutes). This may cause an increase in link state database size.

Example: `IP Config> set router-id 128.185.120.209`

Listing the Router ID Default IP Address

To list the router ID, at the `IP Config>` prompt, enter:

`list address`

Deleting the Router ID Default IP Address

To delete the router ID, at the `IP Config>` prompt, enter:

`set router-id 0.0.0.0`

Configuring a Static Route

Adding a Route

This command adds static network/subnet routes to the router's IP configuration. To add a route, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>add route ip-network/subnet ip-mask next-hop-address cost</code>
2	Press Return.

When dynamic routing information is not available for a particular destination, static routes are used. The destination is specified by an IP address (*ip-network/subnet*) with an address mask (*ip-mask*). For example, if the destination is a subnet of a class B network, and the third byte of the IP address is used as the subnet portion, the address mask is set to 255.255.255.0.

The route to the destination is specified by the IP address of the *next hop* and the *cost* of routing the packet to the destination. The next hop must be on the same subnet as one of the router's directly connected interfaces.

Example: `IP Config> add route 17.0.0.0 255.0.0.0 128.185.123.22 6`

Changing a Route

To change a route, at the `IP Config>` prompt, enter:

`change route destination new-mask new-first-hop-address new-cost`

Deleting a Route

To delete a route, at the `IP Config>` prompt, enter:

`delete route destination-mask`

Listing a Route

To list a route, at the `IP Config>` prompt, enter:

`list route`

This command displays the list of static network/subnet routes that were configured. It also lists any configured default gateways.

Configuring Routing

Setting the Routing Table Size

This command sets the size of the router's IP routing table. The default size is 768 entries. To set the routing table size, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set <u>routing table-size</u> number</code>
2	Press Return.

Setting the routing table size too small causes dynamic routing information to be discarded. Setting the routing table size too large wastes router memory resources.

Example: `IP Config> set routing table-size 1000`

Listing the Routing Table Size

To list the routing table size, at the `IP Config>` prompt, enter:

`list size`

This command displays the routing table size, reassembly buffer size, and the route cache size.

Configuring Access Controls

Adding Access Controls

To add access controls, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>add access-control type ip-source source-mask ip-dest dest-mask first-protocol last-protocol first-port last-port</code>
2	Press Return. Before add access control takes effect, you must: <ul style="list-style-type: none">• Enter the <code>set access-control on</code> command.• Add at least one access control.• Reboot the line card. All subsequent add access-control commands will take effect immediately.

Enabling access controls will reduce the IP forwarding performance. This reduction is approximately 10 percent and is constant regardless of the length or order of the access control list.

This command adds an IP access control entry to the end of the global IP access control list. Each entry must be assigned the following: type, IP source, source mask, IP destination, and destination mask. The type must be either inclusive (I) or exclusive (E). The *ip-source* and *ip-destination* fields are in the form of IP addresses in dotted decimal notation. Optionally, you may specify an IP protocol number range with the *first-protocol* and *last-protocol* fields, which are an inclusive range of IP protocols that match this entry. If a range of protocols was specified which include TCP and UDP protocol numbers, you may specify a TCP and UDP destination port number range with the *first-port* and *last-port* fields, which are an inclusive range of TCP and UDP ports that matches this entry.

[Table 3-1](#) provides examples of setting up IP access controls.

Configuring Access Controls

Table 3-1: IP Access Control Examples

Command	Description
IP Config> add access-control inclusive 0.0.0.0 0.0.0.0 192.67.67.20 255.255.255.255 6 6 25 25	Allows any host to send packets to the SMTP TCP socket on 192.67.67.20.
IP Config> add access-control exclusive 150.150.1.0 255.255.255.0 150.150.2.0 255.255.255.0 0 255 0 65535	Prevents any host on subnet 1 of Class B network 150.150.0.0 from sending packets to hosts on subnet 2 of Class B network 150.150.0.0 (assuming a 1-byte subnet mask).
IP Config> add access-control inclusive 0.0.0.0 0.0.0.0 0.0.0.0 0.0.0.0 17 17 520 520	Allows the router to send and receive all RIP packets.
IP Config> add access-control inclusive 0.0.0.0 0.0.0.0 0.0.0.0 0.0.0.0 89 89	Allows the router to send and receive all OSPF packets.
IP Config> add access-control inclusive 0.0.0.0 0.0.0.0 0.0.0.0 0.0.0.0 0 255 0 65535	This is the wildcard inclusive entry which allows the router to send and receive all IP packets.

If IP access control is enabled, you must be careful with packets that the router originates and receives. Be sure not to filter out the RIP or OSPF packets being sent or received by the router. The easiest way to do this is to add a wildcard inclusive entry as the last in the access control list. Alternately, you can add specific entries for RIP or OSPF, or both, perhaps with restrictive addresses and masks. Note that some OSPF packets are sent to the class D multicast addresses 224.0.0.5 and 224.0.0.6, which is important if address checking is being done for routing protocols.

Deleting Access Controls

To delete an access control, at the `IP Config>` prompt, enter:

delete access-control *record-number*

Moving Access Controls

To move an access control, at the `IP Config>` prompt, enter:

move access-control *from# to#*

This command places record number *from#* immediately after record number *to#*. After you move the records, they are immediately renumbered to reflect the new order.

Listing Access Controls

To list access controls, at the `IP Config>` prompt, enter:

list access-controls

This command prints the configured access control mode (enabled or disabled) and the list of configured access control records. Each record is listed with its record number. This record number can be used to reorder the list with the **IP move access-control** command.

Enabling Access Controls

The IP access control system allows the IP forwarder to control packet forwarding based on source and destination IP addresses, IP protocol number, and destination port number for the TCP and UDP protocols. This can control access to particular classes of IP addresses and services. To set access control, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <u>set</u> <u>access-control</u> <u>on</u>
2	Press Return.

Enabling access controls will reduce the IP forwarding performance. This reduction is approximately 10 percent and is constant regardless of the length or order of the access control list.

The IP access control system is based on one global ordered list of inclusive and exclusive access control entries. If access control is enabled, each IP packet being forwarded or received is subject to the access control list. Each entry in the list may be inclusive or exclusive, permitting or denying forwarding.

Configuring Access Controls

If access controls are enabled and the access control entry list is empty, all packets will be included. If access controls are enabled and the entry list is not empty, all packets not included by an entry in the list will be dropped (excluded).

For each received packet, the headers are compared to all specified fields in each entry in the list in turn. If the entry matches the packet and the entry is inclusive, the packet is forwarded. If the entry is exclusive, the packet is dropped. If no entry matches after going through the entry list the packet is dropped.

Each entry has an IP address mask and result pair for both the source and destination IP addresses. An address is logically “AND-ed” with the mask, and compared to the result. For example, a mask of 255.0.0.0 with a result of 26.0.0.0 matches any address with 26 in the first byte. A mask of 255.255.255.255 with a result 192.67.67.20 matches only the IP host 192.67.67.20. A mask of 0.0.0.0 with a result of 0.0.0.0 is a wildcard, and matches any IP address.

Each entry may also have an optional IP protocol number range. This applies to the protocol byte in the IP header. Any IP packet with a protocol value within the specified range matches. A range of 0 to 255 matches all IP packets. The commonly used protocol numbers are 1 for ICMP, 6 for TCP, 17 for UDP, and 89 for OSPF.

Each entry may also have an optional port number range. This applies only to TCP and UDP packets because the port number is part of the TCP and UDP headers. Any TCP or UDP packet with a destination port number within the specified range matches (TCP and UDP use the same port numbers). A range of 0 to 65535 disables port filtering. Some commonly used port numbers are 21 for FTP, 23 for Telnet, 25 for SMTP, 513 for login, and 520 for RIP.

Configuring Enhanced Proxy ARP

Overview

Enhanced proxy ARP is a method of communicating IP packets between two hosts in different subnets on the same LAN without requiring a router to forward the packets. Enhanced proxy ARP routers use a modified form of RFC 1027 to overcome the restrictions associated with RFC 1027.

Enhanced proxy ARP does not require the *sender IP address* field to be in a directly connected subnet, and the *sender IP address* and *target IP address* fields do not have to be in the same natural network.

Enhanced proxy ARP provides modified RFC 1027 functionality that includes communicating on a LAN, communicating on an extended LAN, and communicating on a VLAN.

Communicating on a LAN

Enhanced proxy ARP allows hosts on the same LAN to communicate directly, regardless of the network or subnet the hosts are assigned. This is accomplished by configuring the hosts to ARP for all destination addresses. In this configuration, hosts can communicate directly with other hosts without a router. Enhanced proxy ARP allows hosts to communicate without a router in subnets that are not in the same natural network.

Communicating on a Routed LAN

Separate LANs connected by a router form an extended LAN. When hosts on different LANs communicate over an extended LAN, then the router connecting them will proxy for the sender host and respond to the ARP request regardless of the destination network.

Enhanced proxy ARP on a routed LAN also provides indirect proxy (proxy-on-behalf) and compliments ICMP redirects with ARP-response redirects.

Indirect Proxy

A router that has ARP routing enabled and proxy-on-behalf enabled (refer to the section titled [Setting Enhanced Proxy ARP](#) on page 3-19) can optionally issue ARP responses on behalf of routers that are not running proxy ARP. When an ARP request is received and the output interface is the same as the input interface and the next hop is a router, then the receiving router issues an ARP response with the next hop router's MAC address in the *sender hardware address* field instead of its own address.

Configuring Enhanced Proxy ARP

ARP Redirect

When enhanced proxy ARP is enabled, an unsolicited ARP response is sent whenever an Internet Control Message Protocol (ICMP) redirect is sent. ICMP redirect is ignored because hosts check to determine the gateway issuing the redirect is the gateway the host is using for forwarding, but enhanced proxy ARP does not use a gateway and ICMP redirect is ignored.

The unsolicited ARP response maps the destination IP address to the MAC address of the redirected router. This eliminates the problem of ICMP redirects being ignored by hosts with ARP enabled (RFC 1027).

Communicating on a VLAN

Enhanced proxy ARP can be used on VLAN environments to ensure that packets flowing between two hosts in different subnets or networks on different ports of a GIGAswitch GS2000 but in the same VLAN will be switched instead of routed.

For example, host A and host B are configured on different ports in different IP subnets of the same VLAN and both have ARP enabled. Host A is connected to host B through an enhanced proxy ARP routing GIGAswitch GS2000. Normally, IP packets between host A and host B are routed by the GIGAswitch GS2000, but with ARP routing enabled, the hosts send packets directly to each other's MAC address using the switch capabilities of the GIGAswitch GS2000, thus improving performance.

Configuring Hosts for Enhanced Proxy ARP

To communicate directly over a LAN environment using enhanced proxy ARP, you must configure hosts to ARP for all destination addresses. The following sections describe how to configure common operating systems for ARP routing.

Windows NT Hosts

To configure a Windows NT host, perform the following steps:

Step	Action
1	Log in as the administrator.
2	From the Control Panel, select the Network icon.
3	Choose TCP/IP network from the list box and click the Configure button.
4	Change the gateway address to be your local IP address.
5	Click on the OK button. The configuration is complete.

Configuring Enhanced Proxy ARP

Windows 95 Hosts

To configure a Windows 95 host, perform the following steps:

Step	Action
1	From the Control Panel, click on the Network icon.
2	Highlight the TCP/IP icon from the list box in the Configuration tab and click on the <u>P</u> roperties button. The TCP/IP Properties window appears.
3	From the TCP/IP Properties window, click on the Gateway tab. Remove any existing gateway addresses in the <u>I</u> nstalled gateways box.
4	Enter the gateway address to be your local IP address and click on the <u>A</u> dd button.
5	Click on the OK button. The configuration is complete.

DIGITAL UNIX and LINUX Hosts

Modify the `/etc/routes` file and add the following entry where *n* is the IP address of the host.

```
/etc/route add default n.n.n.n 0
```

MIPS ULTRIX Hosts

Use the `/etc/route` program to add a default route into the routing table (insert the line in `/etc/rc.local` to ensure it is executed at startup) where *n* is the IP address.

```
/etc/route add default n.n.n.n 0
```

Windows 3.1 PATHWORKS Hosts

To configure Windows 3.1 PATHWORKS hosts, perform the following steps:

Step	Action
1	Edit the <code>cfg*.tpl</code> file currently being used. To determine the correct <code>cfg</code> file, access the <code>pathworks</code> directory and open the <code>select.ini</code> file.
2	In the <code>cfg*.tpl</code> file, replace “TCPIPgateway=” with <code>0.0.0.0</code> .
3	Save the file and restart the system.

Configuring Enhanced Proxy ARP

Windows NT 4.0 DHCP Servers

The DHCP server, NT 4.0 Service Pack 2, supports configuring hosts with their own address as the default gateway. To enable this feature for all clients in a scope, add the following value to the registry, where *n.n.n.n* is the subnet for the scope.

```
HKEY_LOCAL_MACHINE\
SYSTEM\
CurrentControlSet\
Services\
DHCPserver\
Configuration\
Subnets\
n.n.n.n\
SwitchedNetworkFlag=1
(REG_DWORD)
```

NOTE

Enable the DHCP server function before you install the NT Service Pack 2 to ensure that the DHCP server DLL's and images are upgraded from the Service Pack.

Enabling Enhanced Proxy ARP

Enabling enhanced proxy ARP globally enables enhanced proxy ARP on all LAN interfaces running IP that have not been disabled with the **set enhanced-proxy-arp off** command.

To enable enhanced proxy ARP, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable enhanced-proxy-arp</u>
2	Press Return. Enhanced proxy ARP is enabled.

Disabling ARP Routing

To disable enhanced proxy ARP on all LAN interfaces running IP, at the `IP Config>` prompt enter:

disable enhanced-proxy-arp

Setting Enhanced Proxy ARP

When enhanced proxy ARP is enabled or disabled, it enables or disables all LAN interfaces running IP. You can also selectively set a specific interface to enable or disable enhanced proxy ARP.

To set an interface to disable enhanced proxy ARP, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>set enhanced-proxy-arp off</u> Interface number [0]? 25
2	Press Return. Enhanced proxy ARP is disabled on interface 25.

Setting a specific interface to re-enable enhanced proxy ARP sets enhanced proxy ARP and sets the router's operating parameters, including whether proxy-on-behalf should be enabled on the interface. Normally, proxy-on-behalf is disabled by default.

To set an interface to enable enhanced proxy ARP, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>set enhanced-proxy-arp on</u> Interface number [0]? 25 Proxy ARP on behalf of other Routers [Yes]? no
2	Press Return. Enhanced proxy ARP is enabled on interface 25.

Configuring Enhanced Proxy ARP

Adding Enhanced Proxy ARP Subnets

This command is used to prevent enhanced proxy ARP routing for destinations in certain subnets. For example, a LAN configured with subnets A, B, and C has a router in subnet A that does not have an address in subnet C. When an ARP request is sent by a host in subnet B to a host in subnet C, the router will initiate an ARP request destined to the host in subnet C.

NOTE

Adding enhanced proxy ARP subnets can be accomplished on VLAN interfaces only.

To add enhanced proxy ARP subnets to the router, perform the following steps:

Step	Action
1	At the IP Config> prompt, enter: add enhanced-proxy-arp subnet Which net is this subnet for [0]? 25 Subnet number [0.0.0.0]? 16.39.180.0 Subnet mask [255.0.0.0]? 255.255.255.0
2	Press Return. An enhanced proxy ARP subnet is added to interface 25, as an example.

Deleting Enhanced Proxy ARP Subnets

To delete enhanced proxy ARP subnets, at the IP Config> prompt enter:

delete enhanced-proxy-arp subnet

Configuring BootP Forwarding

Enabling BootP Forwarding

This command turns on BootP packet forwarding. To use BootP forwarding, you must also add one or more BootP servers with the **add BootP-server** command. To enable BootP forwarding, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable</u> <u>bootp-forwarding</u> Maximum number of forwarding hops, ranges 0-16, default [4]? Enter the maximum number of application hops you want the BootP request to go. This is the maximum number of BootP relay agents that can forward the packet. This is <i>not</i> the maximum number of IP hops to the BootP server. A typical value for this parameter is 1
2	Press Return.
3	Minimum seconds before forwarding, ranges 0-65535, default [0]? Enter the number of seconds you want the client to wait before the BootP request is forwarded. A typical value for this parameter is 0.
4	Press Return.
5	Relay in same VLAN [No]?
6	Press Return.

Disabling BootP Forwarding

To disable BootP forwarding, at the `IP Config>` prompt, enter:

disable bootp-forwarding

Listing BootP Forwarding

To list BootP forwarding, at the `IP Config>` prompt, enter:

list bootp

This command indicates whether BootP forwarding is enabled or disabled.

Configuring a BootP Server

Adding a BootP Server

BootP is a bootstrap protocol used by a diskless workstation to learn its IP address and the location of its boot file and boot server. This command adds a BootP server to a network configuration. To add a BootP server, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>add bootp-server server-ip-address</code>
2	Press Return.

Acting as a bootp relay agent, your router accepts and forwards BootP requests to the BootP server.

NOTE

Before the **list all** command can display the BootP server address, you must enable BootP forwarding with the **enable BootP forwarding** command.

Example: `IP Config> add bootp-server 128.185.123.22`

Deleting a BootP Server

To delete a BootP server, at the `IP Config>` prompt, enter:

`delete bootp-server server-ip-address`

Listing a BootP Server

To list BootP servers, at the `IP Config>` prompt, enter:

`list bootp`

This command displays a list of configured BootP servers.

Configuring Broadcast Addresses

Setting Broadcast Addresses

This command specifies the IP broadcast format that the router uses when broadcasting packets out a particular interface. IP broadcasts are most commonly used by the router when sending RIP update packets. To set a broadcast address, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set broadcast-address ip-address style fill-pattern</code>
2	Press Return.

The *style* parameter can take either the value **local-wire** or the value **network**. Local-wire broadcast addresses are either all ones (255.255.255.255) or all zeros (0.0.0.0). Network style broadcasts begin with the network and subnet portion of the IP interface address.

You can set the *fill-pattern* parameter to either 1 or 0. This indicates whether the rest of the broadcast address (other than the network and subnet portions, if any) is set to all ones or all zeros.

When receiving, the router recognizes all forms of the IP broadcast address.

Examples: `IP Config> set broadcast-address 192.9.1.11 local-wire 1`

`IP Config> set broadcast-address 192.9.1.11 network 0`

Listing Broadcast Addresses

To list broadcast addresses, at the `IP Config>` prompt, enter:

`list all`

This command displays a list of broadcast addresses.

Configuring a Default Gateway

Setting Default Network Gateway

Routers send packets having unknown destinations (destinations not present in the routing table) toward the default gateway. A default gateway is configured in the router by specifying the next hop to use to get to the default gateway and the cost of sending packets to the default gateway. To set the default network gateway, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set default network-gateway gateway-ip-address cost</code>
2	Press Return.

Deleting Default Network Gateway

To delete the default network gateway, at the `IP Config>` prompt, enter:

`delete default network-gateway`

Configuring a Default Subnet Gateway

Setting Default Subnet Gateways

There can be a default subnet gateway configured for each subnetted network that the router knows. When the router attempts to forward a packet to a destination belonging to the subnetted network, but that destination cannot be found in the routing table, the packet is forwarded instead to the default subnet gateway.

Configuring default subnet gateways is the same as configuring the preceding default network gateway. The only difference is that you must specify the subnetted network on the command line.

To set the default subnet gateway, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set default subnet-gateway subnetted-network subnet-gateway-ip-address cost</code> Example: <code>IP Config></code> <code>set default subnet-gateway 128.0.0.0 128.185.123.22 2</code>
2	Press Return.

Deleting Default Subnet Gateways

To delete the default subnet gateway, at the `IP Config>` prompt, enter:

`delete default subnet-gateway subnetted-network`

Configuring Directed Broadcast

Enabling Directed Broadcast

This command enables the forwarding of IP packets whose destination is a nonlocal (for example, remote LAN) broadcast address. To enable directed broadcast, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable directed-broadcast</u>
2	Press Return.

With directed broadcast, the packet is originated by the source host as a unicast where it is then forwarded as a unicast to a destination subnet and exploded into a broadcast. These packets can be used to locate network servers. This command enables both the forwarding and exploding of directed broadcasts. The IP packet forwarder never forwards link-level broadcasts, unless they correspond to class D IP addresses. The default setting for this feature is enabled.

NOTE

Forwarding and exploding cannot be implemented separately. Also, the router does not forward subnet-wide IP broadcasts.

Disabling Directed Broadcast

To disable directed broadcast, at the `IP Config>` prompt, enter:

disable directed-broadcast

Configuring a Filtered Route

Adding a Filter

This command designates an IP network/subnet to be filtered. To add a filter, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>add filter ip-address ip-mask</code>
2	Press Return.

IP packets are not forwarded to filtered networks/subnets, nor is routing information disseminated concerning such destinations. Packets destined for filtered network/subnets are simply discarded.

You must specify a filtered network/subnet together with its subnet mask. For example, to filter a subnet of a class B network, using the third byte for subnetting, the mask is 255.255.255.0.

Using the filter mechanism is more efficient than IP access controls, although not as flexible. Filters also affect the operation of the IP routing protocols, unlike access controls.

Example: `IP Config> add filter 127.0.0.0 255.0.0.0`

Deleting a Filter

To delete a filter, at the `IP Config>` prompt, enter:

`delete filter ip-address ip-mask`

Listing a Filter

To list a filter, at the `IP Config>` prompt, enter:

`list filter`

This command displays the networks/subnets that are filtered.

Configuring Path Splitting

Enabling Path Splitting

Path splitting allows packets to be routed to their destination address through any one of four equal-cost paths. When the GIGAswitch GS2000 receives a packet with a new destination address, it assigns a path to the packet based on the destination address. All the packets with the same destination address are then forwarded using the assigned path.

If IP access controls are enabled, then the source address, destination address, protocol type and destination port number (for UDP and TCP protocol types) are all used when determining the path. Packets with the same values for all of these fields will use the same path. The default setting for path splitting is set to disable.

To enable path splitting, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable path-splitting</u>
2	Press Return.

Disabling Path Splitting

To disable path splitting, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>disable path-splitting</u>
2	Press Return.

Configuring Reassembly Size

Setting Reassembly Size

This command configures the size of the buffers that are used for the reassembly of fragmented IP packets. The default size is 12000. To set the reassembly size, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>set reassembly-size number</code>
2	Press Return.

Example: `IP Config> set reassembly-size 12000`

Listing Reassembly Size

To list the reassembly buffer size, at the `IP Config>` prompt, enter:

`list size`

This command displays the routing table size, and the reassembly buffer size.

Configuring UDP Broadcast Forwarding

User datagram protocol (UDP) broadcast forwarding provides controlled application level functionality that forwards local broadcasts to other specified nodes or networks by using UDP ports. Controlled forwarding is accomplished by forwarding specific broadcasts to specified networks or hosts.

Advantages of UDP Forwarding

Without UDP forwarding, an IP router cannot broadcast outside of the current broadcast domain. With UDP forwarding, you can selectively broadcast to other networks outside of the broadcast domain.

Some client applications search for servers by broadcasting the request. Most of these broadcasts are link layer broadcasts in the same network as the server. A typical example is a NetBIOS Name Server running over TCP/IP services. As the network grows and network components such as bridges and routers are being added, users no longer need to be constrained to local servers. Users can now reach the server outside the broadcast domain using UDP forwarding.

The following sections describe how to add and delete UDP broadcast forwarding and how to disable and enable UDP broadcast forwarding.

Adding a UDP Broadcast Server

Adding a UDP broadcast server automatically enables the UDP port being added. To add UDP broadcast forwarding, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>add broadcast-forwarder udp udp-port-number interface-number destination-ip-address</code>
2	Press Return. UDP broadcast forwarding for the associated port is now added to the list.

Specifying **all** for the interface number includes all interface numbers to the specified UDP port and destination IP address.

Example: `IP Config> add br u 25 all 124.24.10.0`

Deleting a UDP Broadcast Server

To delete UDP broadcast server, at the `IP Config>` prompt enter:

delete broadcast-forwarder udp *udp-port-number interface-number destination-ip-address*

Specifying **all** for the destination IP address deletes broadcast forwarding for all IP addresses with the specified UDP port number and interface number.

Example: `IP Config> del br u 25 9 all`

Specifying *all* for the interface number deletes *only* the add command entry and specified UDP port and destination IP address that used **all** as the interface number. Previous UDP add command entries for that port prior to the delete command entry are not affected.

Example:

In the following example, CLI entry 1 adds broadcast forwarding to UDP port 25, interface 9, with a destination IP address of 124.35.13.0. CLI entry 2 uses a different UDP port and interface number, but the destination address is the same. CLI entry 3 adds broadcasting on all interfaces on UDP port 25 to destination IP address 124.35.13.0. CLI entry 4 deletes only CLI entry 3 parameters. CLI entry 1 parameters are not affected and broadcast forwarding on UDP port 25, interface 9 remains active.

CLI Entry	IP Config> Command
1	add br u 25 9 124.35.13.0
2	add br u 26 7 124.35.13.0
3	add br u 25 all 124.35.13.0
4	del br u 25 all 124.35.13.0

Configuring UDP Broadcast Forwarding

Disabling UDP Broadcast Forwarding

To disable UDP broadcast forwarding, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>disable broadcast-forwarding udp udp-port interface-number</code> Note: the default interface is all .
2	Press Return. UDP broadcast forwarding is now disabled.

Enabling UDP Broadcast Forwarding

To enable UDP broadcast forwarding, at the `IP Config>` prompt enter:

`enable broadcast-forwarding udp udp-port interface-number`

Examples of Configuring UDP Broadcast Forwarding

In the following two examples, IP networks N1 through N5 are configured on VLAN Interfaces (VIs). You want networks N1, N2, and N3 to forward broadcast messages to network N4, but not to network N5.

Both examples provide two methods of configuring a UDP forwarder with the same results.

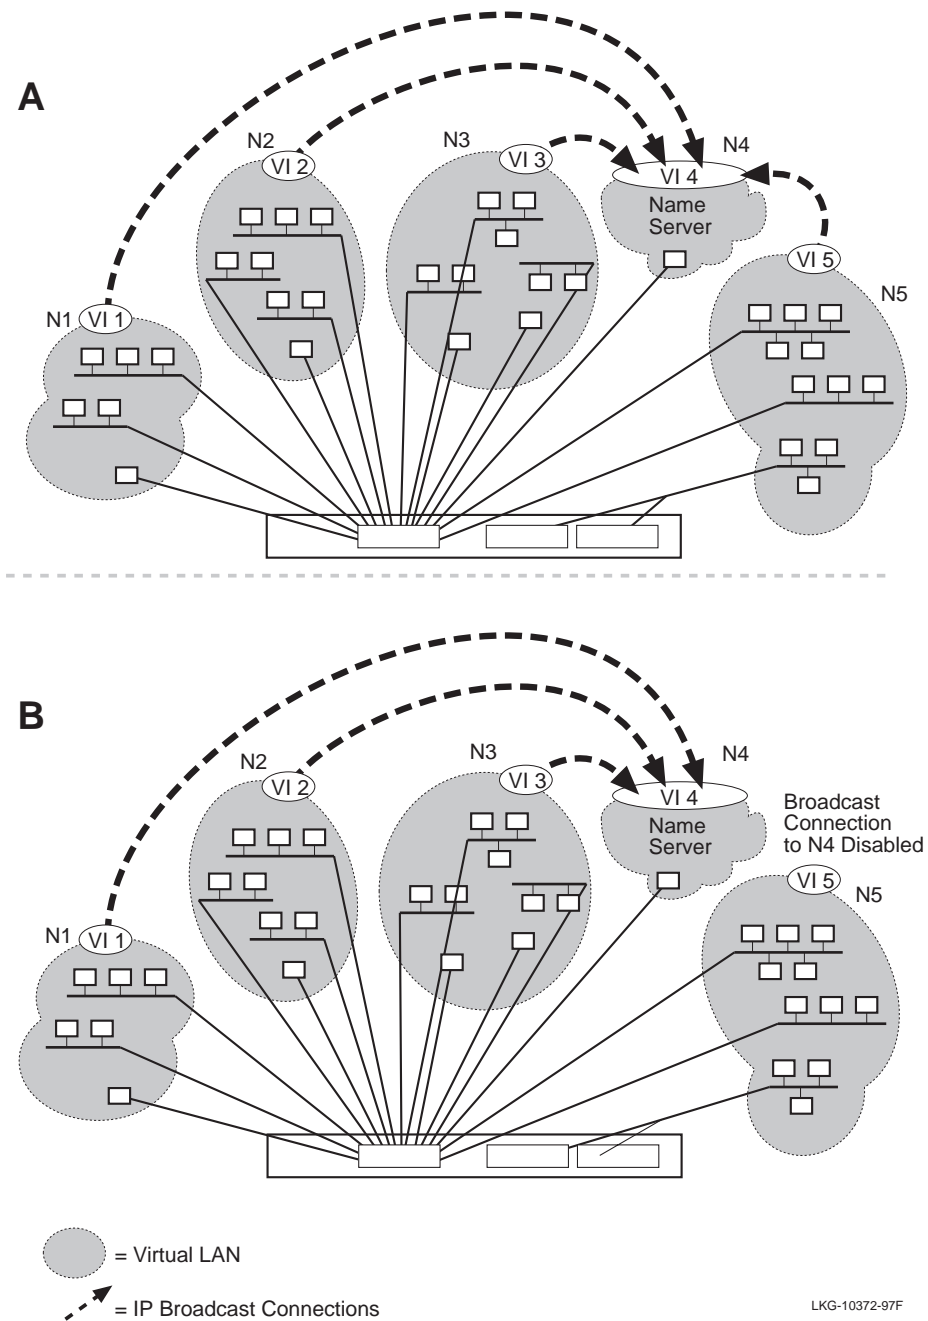

Example 1

To configure UDP forwarding, issue an add command to broadcast from all networks to network N4, using UDP port 200. Next, disable network N5 from broadcasting messages to other networks. The following steps and [Figure 3-1](#) provide an example of this configuration.

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>add broadcast-forwarder udp 200 all network 4 ip-address</code> This command adds and enables all interfaces. (See Figure 3-1A)
2	At the <code>IP Config></code> prompt enter: <code>disable broadcast-forwarding udp 200 5</code> This command disables interface N5. (See Figure 3-1B)

Configuring UDP Broadcast Forwarding

Figure 3-1: UDP Broadcast Forwarder Example

Configuring UDP Broadcast Forwarding

Example 2

To configure UDP forwarding, issue an add command to broadcast from networks N1, N2, and N3 to network N4, using UDP port 200. The following steps provide an example of this configuration:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code>add broadcast-forwarder udp 200 1 network 4 ip-address</code> This command adds and enables N1 interface.
2	At the <code>IP Config></code> prompt enter: <code>add broadcast-forwarder udp 200 2 network 4 ip-address</code> This command adds and enables N2 interface.
3	At the <code>IP Config></code> prompt enter: <code>add broadcast-forwarder udp 200 3 network 4 ip-address</code> This command adds and enables N3 interface.

Listing UDP Broadcast Forwarding

To list broadcast forwarding, at the `IP Config>` prompt, enter:

`list broadcast-forwarding`

This command displays the protocol, port, interface, state, and destination of the broadcast forwarder.

Configuring New Software

When you configure your router, you can configure it to accommodate future software upgrades. The DIGITAL GIGAswitch GS2000 line card allows you to upgrade your line card remotely to the latest release using TFTP. To accomplish an upgrade, the line card may require a gateway IP address, which can be configured at any time.

When routing is enabled, the primary method to define the default gateway when performing a load or reload command is by using the `IP Config> set default network-gateway` command (preferred method), or as arguments to the load or reload commands. However, when using the DIGITAL clearVISN Flashloader or Recovery Manager applications, the default gateway cannot be specified on clearVISN.

If you cannot use the `IP Config> set default network-gateway` command, the `IP Config> set ip-host-only-default network-gateway` command can be used to define a gateway address. This method can only be used when performing a software upgrade or a restore of configuration information. During the upgrade or restore process, routing protocols such as, RIP and OSPF are not enabled.

For additional information regarding software upgrade procedures, refer to the *DIGITAL GIGAswitch GS2000 Line Card Management* guide.

Setting the IP Host-Only Default Network Gateway

To load new software to your router, the IP host-only default network gateway and subnet gateway commands may be required in conjunction with installing new software. To set the IP host-only default network gateway, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <code><u>set ip-host-only-default network-gateway ip-address</u></code>
2	Press Return.

Deleting the IP Host-Only Default Network Gateway

To delete the IP host-only default network gateway, at the `IP Config>` prompt, enter:

`delete ip-host-only-default network-gateway`

Listing IP Protocols

Setting the IP Host-Only Default Subnet Gateway

To set the IP host-only default subnet gateway, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: <u>set ip-host-only-default subnet-gateway ip-address</u>
2	Press Return.

Deleting the IP Host Only Default Subnet Gateway

To delete IP host-only default subnet gateway, at the `IP Config>` prompt, enter:

delete ip-host-only-default subnet-gateway

Listing IP Protocols

This command displays the configured state of the IP routing protocols (OSPF and RIP) along with whether ARP subnet routing is enabled or disabled. To list the configured routing protocols, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>list protocols</u>
2	Press Return.

Monitoring IP

This section describes tasks you can perform to monitor your router's IP protocol. To access the IP Monitor process, perform the following steps:

Step	Action
1	At the Main prompt (Main>) enter: <u>m</u>onitor
2	Press Return. The Monitor prompt (Monitor>) is displayed.
3	If the prompt is not displayed, press Return a second time.
4	At the Monitor> prompt, enter: <u>i</u>p
5	Press Return. The IP> prompt is displayed.

From the IP> prompt, you can perform specific tasks to determine IP parameters, statistics, routing destinations, routing table contents, interface addresses, and routing paths.

Monitoring IP Access Control

You can monitor the router’s access control system to determine which IP addresses and services your router is configured to handle. To display the access control list, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <code><u>a</u>ccess</code>
2	Press Return. The access control list is displayed.

Example

`IP> access`

Access control currently enabled
Access control run 8 times, 7 cache hits

List of access control records:

	Ty	Source	Mask	Destination	Mask	Beg Pro	End Pro	Beg Prt	End Prt	Invoc
0	I	0.0.0.0	00000000	111.67.67.21	FFFFFFF	6	6	25	25	0
1	E	151.151.1.0	FFFFFF00	150.150.2.0	FFFFFFF	0	255	0	655	0
2	I	0.0.0.0	00000000	0.0.0.0	00000000	89	89	0	655	27

The `Invoc` column above contains the number of times an access control lookup match occurred for the associated filter. The `invoc` counter increments when the access control list is searched and the associated filter is the first matching entry.

The `invoc` counter can increment more than once per packet or not at all (when the result has been cached). Therefore, the entry does not necessarily represent the number of packets that were forwarded or terminated on a match for the associated filter.

Monitoring ICMP Counters

Internet Control Message Protocol (ICMP) is a part of IP that handles error and control messages, including an echo request/reply function to test whether a destination is reachable and responding. ICMP provides error, status and administrative messages that are incorporated into the data field of an IP packet. To display the list of ICMP counters, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <code>icmp-counters</code>
2	Press Return. A list of ICMP counters are displayed.

Example

`IP> icmp-counters`

ICMP counters	Receive	Transmit
Total number of messages	15	17
Number of errors	0	0
Destination Unreachable	0	0
Time Exceeded	0	2
Parameter Problem	0	0
Source Quench	0	0
Redirect	0	0
Echo request	13	0
Echo reply	0	13
Timestamp request	1	0
Timestamp reply	0	1
Address Mask request	1	0
Address Mask reply	0	1

Monitoring ICMP Counters

Field	Description
Total number of messages	Total number of ICMP messages sent and received.
Number of errors	Generic errors, such as buffer allocation errors, detected by the router.
Destination Unreachable	Used by the router or the destination host and is invoked if a router encounters problems reaching the destination network specified in the IP destination address. Also, the destination host can invoke this if an identified higher-level protocol is not available on the host or if a specified port is not available.
Time Exceeded	Initiated by the router when the time-to-live value becomes zero or if a timer expires during reassembly of a fragmented datagram.
Parameter Problem	Initiated by a host or the router if it encounters problems processing any part of an IP header.
Source Quench	Flow and congestion control that is used if the router has insufficient buffer space for queuing incoming datagrams.
Redirect	Invoked by the router and sent to the source host and is used to provide routing management information.
Echo request	A PING message sent to any IP address to determine the state of the internet or a network segment.
Echo reply	A PING message sent by a host in response to an echo request.
Timestamp request	This is used by the router and hosts to determine the delay incurred when delivering packets through a network.
Timestamp reply	Timestamp values sent by a host in response to a timestamp request.
Address Mask request	Used by a host to obtain a subnet mask used on the host's network. The requesting host can send the request directly to a router or broadcast it.
Address Mask reply	A reply from an address mask agent host or any authoritative originator of the address mask on the network containing the network's subnet mask.

Monitoring IP Interface Addresses

You can display a list of your router's IP interface addresses. Each address in the list contains an interface type, interface mask, and status. To display IP interface addresses, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <u>i</u>nterface
2	Press Return. IP interface addresses are displayed.

Example

`IP> interface`

Ifc	Name	IP Addresses(es)	Mask(s)	Status
25	VLAN/25	128.185.123.22	255.255.255.0	Down
56	VLAN/56	128.185.124.23	255.255.255.0	Up

Monitoring IP Routing Table Contents

You can display the contents of the IP routing table and determine the protocol type, destination network, destination mask, cost, age, and next hop for each entry, as well as the routing table size. To display the IP routing table, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <u>d</u>ump
2	Press Return. IP routing table information is displayed.

Example

`IP> dump`

Type	Destination Net	Mask	Cost	Age	Next hop
Stat*	0.0.0.0	00000000	0	0	16.20.48.254
Sbnt	16.0.0.0	FF000000	1	0	16.20.48.254
SPF*	16.20.0.0	FFFF0000	1	1	VLAN/26

Default gateway in use.

Type	Cost	Age	Next hop
Stat	0	0	16.20.48.254

Routing table size: 768 nets (67584 bytes), 4 nets known

Monitoring IP Routing Table Contents

Field	Description
Type (route type)	<p>Indicates how the route was derived.</p> <ul style="list-style-type: none"> • Sbnt — Indicates that the network is subnetted; such an entry is a placeholder only. • Dir — Indicates a directly connected network or subnet. • RIP — Indicates the route was learned through the RIP protocol. • Del — Indicates the route was deleted. • Loc1 — Indicates the local interface address. • Stat — Indicates a statically configured route. • Fltr — Indicates a routing filter. • SPF — Indicates that the route is an OSPF intra-area route. • SPIA — Indicates that the route is an OSPF inter-area route. • SPE1, SPE2 — Indicates OSPF external routes (types 1 and 2, respectively). • Rnge — Indicates a route type that is an active OSPF area address range and is not used in forwarding packets.
Destination Net	IP destination network/subnet.
Masks	IP address mask.
Cost	Route cost.
Age	For RIP routes, the time that has elapsed since the routing table entry was last refreshed.
Next hop	Displays either the VLAN transmit interface, indicating the next hop exists, or the IP address of the next hop for static routes.

An asterisk (*) after the route type indicates that the route has a static or directly connected backup. A percent sign (%) after the route type indicates that RIP updates are always accepted for this network/subnet.

A number in parentheses at the end of the column indicates the number of equal-cost routes to the destination. The first hops belonging to these routes can be displayed with the IP route command.

Monitoring IP Routing Destinations

You can determine if IP routing destinations exist for a specific IP destination. To determine if a specific IP destination exists, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <code>route ip-destination-address</code>
2	Press Return. IP routing table information is displayed.

Example

```
IP> route 128.185.232.0
Destination: 128.185.232.0
Mask: 255.255.255.0
Route type: RIP
Distance: 3
Age: 1
Tag 0
Next hop(s): 128.185.146.4 (VLAN/15)
```

Monitoring IP Routing Paths

You can display the entire IP routing path to a given destination, hop by hop, using traceroute. Traceroute sends out three probes and prints the IP address of the responder, together with the round-trip time associated with the response. To display IP routing paths, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <u>traceroute</u> <i>ip-destination-address</i>
2	Press return. IP destination area address, packet size and the results of the traceroute are displayed

Example

```
IP> traceroute 128.185.142.239
TRACEROUTE 128.185.124.110:      56 data bytes
 1  128.185.142.7  16 ms  0  ms  0  ms
 2  128.185.123.22 16 ms  0  ms 16  ms
 3  * * *
 4  * * *
 5  128.185.124.110 16 ms ! 0 ms ! 0 ms
```

Field	Description
Traceroute	Displays the destination area address and the size of the packet being sent to that address.
1	Displays the first trace showing the destination's NSAP and the amount of time it took the packet to arrive at the destination. The packet is traced three times.
Destination unreachable	Indicates that no route to the destination is available.
3 * * *	Indicates that the router is expecting some form of response from the destination, but the destination is not responding.
4 * * *	

Monitoring IP Routing Paths

The traceroute is done whenever the destination is reached, an ICMP Destination Unreachable is received, or the path length reaches 32 router hops.

When a probe receives an unexpected result, several indications can be displayed. They are:

Probe Result	Description
!N	Indicates that an ICMP Destination Unreachable (net unreachable) was received.
!H	Indicates that an ICMP Destination Unreachable (host unreachable) was received.
!P	indicates that an ICMP Destination Unreachable (protocol unreachable) was received. Since the probe is a UDP packet sent to a strange port, a port unreachable is expected.
!	indicates that the destination was reached, but the reply sent by the destination was received with a TTL of 1. This usually indicates an error in the destination, prevalent in some versions of UNIX. The destination is inserting the probe's TTL in its replies. This unfortunately leads to a number of lines consisting solely of asterisks before the destination is finally reached.

Monitoring IP Static Routes

You can display a list of configured static routes, including filtered routes, default gateways and default subnet gateways using static routes. To display static routes, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <code>static</code>
2	Press return. Static routes are displayed.

Example

`IP> static`

Net	Mask	Cost	Next hop
0.0.0.0	0.0.0.0	1	128.185.123.18
128.185.0.0	255.255.0.0	1	128.185.123.22
192.9.10.0	255.255.255.0	10	128.185.123.22

Field	Description
Net	Indicates the network address of the route.
Mask	Indicates the subnet mask of the IP address.
Cost	Indicates the cost of using this route.
Next hop	Indicates the next router a packet passes through that uses this route.

Each static route's destination is specified by an address-mask pair. Default gateways appear as static routes to destination 0.0.0.0. Default subnet gateways also appear as static routes to the entire IP subnetted network.

Monitoring IP Parameters

You can display a list of configured sizes of specific IP parameters. To display IP parameter sizes, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <u>sizes</u>
2	Press Return. IP parameter sizes are displayed.

Example

`IP> sizes`

Routing table size	(#entries):	768
Table entries used	(#entries):	3
Reassembly buffer size	(bytes):	12000
Largest reassembled pkt	(bytes):	0

Field	Description
Routing table size	Indicates the configured number of entries that the routing table maintains.
Table entries in use	Indicates the number entries used from the routing table.
Reassembly buffer size	Indicates the configured size of the reassembly buffer that is used to reassemble fragmented IP packets.
Largest reassembled packet	Indicates the largest IP packet that this router reassembled.

Monitoring IP Forwarding Statistics

You can display the statistics related to the IP forwarding process, including a count of routing errors, along with the number of packets that were dropped due to congestion. To display IP forwarding statistics, perform the following steps:

Step	Action
1	At the <code>IP></code> prompt, enter: <u>counters</u>
2	Press Return. IP forwarding statistics are displayed.

Example

`IP> counters`

Receive:

Total	(ipInReceives)	0
Dropped, Header Error	(ipInHdrErrors)	0
Dropped, Unknown Protocol	(ipInUnknownProtos)	0
Dropped, Internal Error	(ipInDiscards)	0
To be Forwarded	(ipForwDatagrams)	0
Terminated	(ipInDelivers)	0

Transmit:

Generated	(ipOutRequests)	0
Dropped, No Route	(ipOutNoRoutes)	0
Total		0

Reassembly:

Requests	(ipReasmReqds)	0
Successful	(ipReasmOKs)	0
Failed	(ipReasmFails)	0

(Continued on next page)

Monitoring IP Forwarding Statistics

Fragmentation:

Successful	(ipFragOKs)	0
Failed	(ipFragFails)	0
Created	(ipFragCreates)	0

Routing errors

Routing table overflow	0
Net unreachable	2539
Bad subnet number	0
Bad net number	0
Unhandled broadcast	0
Unhandled multicast	0
Unhandled directed broadcast	0
Attempted forward of LL broadcast	4048

Packets discarded through filter	0
IP multicasts accepted:	0

Ifc	Name	IP input-packet overflow errors
25	VLAN/25	0
26	VLAN/26	0
...		0
56	VLAN/56	0

Monitoring IP Forwarding Statistics

Field	Description
Receive Group	Received packets that were dropped, terminated or forwarded
Transmit Group	Transmitted packets that were generated, dropped or forwarded
Reassembly Group	Packets that were reassembled successfully, failed or requested
Fragmentation Group	Packets that were fragmented successfully, failed or created
Routing table overflow	Lists the number of routes that were discarded due to the routing table being full.
Net unreachable	Indicates the number of packets that were not forwarded due to unknown destinations. This does not count the number of packets that were forwarded to the authoritative router (default gateway).
Bad subnet number	Counts the number of packets or routes that were received for illegal subnets (all ones or all zeros).
Bad net number	Counts the number of packets or routes that were received for illegal IP destinations (for example, class E addresses).
Unhandled broadcast	Counts the number of (nonlocal) IP broadcasts received (these are not forwarded).
Unhandled multicast	Counts the number of IP multicasts that were received but whose address was not recognized by the router (these are discarded).
Unhandled directed broadcast	Counts the number of directed (nonlocal) IP broadcasts received when forwarding of these packets is disabled.
Attempted forward of LL broadcast	Counts the number of packets that are received having nonlocal IP addresses but were sent to a link level broadcast address. These are discarded.
Packets discarded through filter	Counts the number of received packets that were addressed to filtered networks/subnets. These are discarded silently.
IP multicast accepted	Counts the number of IP multicasts that were received and successfully processed by the router.
IP input packet overflows	Counts the number of packets that were discarded due to congestion at the forwarder's input queue. These counts are sorted by the receiving interface.

Chapter 4

Configuring and Monitoring the RIP Interface

Overview

Introduction

Routing Information Protocol (RIP) is a distance-vector protocol (based on the Bellman-Ford technology) that allows routers to exchange information about destinations for computing routes throughout the network. Destinations may be networks or a special destination used to convey a default route.

Bellman-Ford algorithms make each router periodically broadcast its routing tables to all its neighbors. Then a router knowing its neighbors' tables can decide to which destination neighbor to forward a packet.

In This Chapter

This chapter discusses the following topics:

Topic	Page
Configuring RIP	4-2
Configuring Accept RIP Routes	4-7
Configuring RIP to Override Default Routes	4-8
Configuring RIP to Override Default and Static Routes	4-9
Configuring Receiving RIP, Dynamic Nets/Subnets	4-11
Configuring Sending of Routes in RIP	4-13

Configuring RIP

Enabling RIP

When configuring the RIP, you can specify which set of routes the router advertises or accepts on each IP interface, or both. You can also specify how RIP information affects static routing. Since RIP uses broadcast messages for its routing updates, the format of the IP broadcast address must also be specified when using the RIP protocol. To enable RIP, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable rip</u>
2	Press Return. The RIP protocol is now enabled.

When RIP is enabled, use the **enable/disable sending** commands to configure its routing update sending behavior. Its routing update receiving behavior is defined by the **enable/disable receiving** and **enable/disable override** commands.

Example: `IP Config> enable rip`

Disabling RIP

To disable RIP, at the `IP Config>` prompt, enter:

disable rip

RIP Limitations

RIP is primarily intended for use in homogeneous networks of moderate size. Because of this, RIP has the following limitations:

- Autonomous system (AS) diameter limitation of 15 hops.
- RIP's metric (hop count) cannot adequately describe variations in a path's characteristics, sometimes resulting in sub optimal routing.
- Slow to find new routes when the network changes. This search consumes considerable bandwidth, and in extreme cases, exhibits a slow convergence behavior referred to as a *count to infinity*.

NOTE

All bridging router interfaces running RIP must have the same subnet mask.

Configuring RIP

Enabling RIP Flags

By default, RIP advertises all network and subnet routes on all interfaces of the router. Once RIP is enabled, you can configure what it listens to and what it advertises by setting the various RIP flags. These flags are configured on a per-IP-interface basis. The following commands can enable or disable the various flags:

Flag Type	Command Syntax
Sending net routes	enable sending net-routes disable sending net-routes
Sending subnet routes	enable sending subnet-routes disable sending subnet-routes
Sending static routes	enable sending static-routes disable sending static-routes
Sending default-routes	enable sending default-routes disable sending default-routes
Receiving RIP	enable receiving rip disable receiving rip
Receiving dynamic nets	enable receiving dynamic nets disable receiving dynamic nets
Receiving dynamic subnets	enable receiving dynamic subnets disable receiving dynamic subnets
Overriding default	enable override default disable override default
Overriding static routes	enable override static-routes disable override static-routes
Sending poisoned reversed routes	enable sending poisoned reversed routes disable sending poisoned reversed routes

Customizing RIP

In IP, you can customize RIP with a number of configurable flags. Most flags take effect on a specified IP interface address. These flags control sending and receiving RIP information about each router interface.

The set of routes sent out from a particular address is the union of the routes selected by setting any of the following four flags. Subnet-level routes are sent only when the destination subnet is a member of the same IP network as the sending address.

Send Flag Name	Description
Send Net Routes	Sends all network-level routes.
Send Subnet Routes	Sends appropriate subnet-level routes.
Send Default Routes	Advertises a default route if the router itself has a default route.
Send Static and Direct Routes	Advertises all directly connected networks and statically configured routes.

The following flags control how information received by RIP is incorporated into the router's routing tables. Certain flag settings allow RIP routes to override static routing information, but only if the RIP metric is better than the static route's metric.

Receive Flag Name	Description
Override Default	RIP packets received on this IP interface may override the router's default gateway.
Override Static Routes	RIP packets received on this IP interface may override any of the router's statically configured routing information.
Disable RIP Receive	RIP packets received on this IP interface are ignored.
Receive Dynamic Net Routes	When not set, the router accepts RIP updates only for those networks that are specified in an add accept-rip-route command.
Receive Dynamic Subnets	When not set, the router accepts RIP updates only for those subnets that are specified in an add accept-rip-route command.

Configuring RIP

Setting RIP Broadcasts

The RIP protocol uses IP broadcast when sending its routing updates. Since there are different formats of IP broadcast in use, you must specify which broadcast format to use. You specify IP broadcast format on a per-interface basis by using the following command procedures:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>set broadcast-address ip-interface-address</code>
2	Select either <code>local-wire</code> or <code>network</code> from the following prompt: <code>Use a NET or LOCAL-WIRE style address NETWORK?</code>
3	Select whether you want the rest of the broadcast address filled with either ones or zeroes from the following prompt: <code>Fill pattern for wildcard part of address (0 or 1) 0?</code>
4	Press Return. The RIP broadcast is now enabled.

Converting from RIP to OSPF

To convert your autonomous system (AS) from RIP to OSPF, install OSPF on one router at a time, leaving RIP running. Gradually, all your internal routes shift from being learned through RIP to being learned by OSPF (OSPF routes have precedence over RIP routes). If you want to have your routes look exactly as they did under RIP (in order to check that the conversion is working properly), use hop count as your OSPF metric. This is done by assigning the cost of each OSPF interface to 1.

The size of your OSPF system must be estimated when the protocol is enabled. This size estimate should reflect the final size of the OSPF routing domain.

After installing OSPF on your routers, turn on AS boundary routing in all those routers that still need to learn routes through other protocols (RIP, and statically configured routes). Keep the number of these AS boundary routers to a minimum.

Finally, you can disable the receiving of RIP information about all those routers that are not AS boundary routers.

Configuring Accept RIP Routes

Adding Accept RIP Route

Adding accept RIP route allows an interface to accept a RIP route when RIP route filtering is enabled for an interface. To add accept RIP route, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>add <u>accept-rip-route</u> ip-network/subnet</code>
2	Press Return.

You can list of networks/subnets that are already entered using the **list rip-routes-accept** command. You can enable the input filtering of RIP routes on a per-IP-interface basis. This is done separately for network-level routes (for example, a route to 10.0.0.0) and for subnet-level routes (for example, a route to 128.185.0.0). To enable input filtering of network-level routes on an IP interface, use the **disable dynamic nets** command. To enable input filtering of subnet-level routes, use the **disable dynamic subnets** command.

Example: `IP Config> add accept-rip-route 10.0.0.0`

Deleting Accept RIP Route

To delete an accept-rip-route, at the `IP Config>` prompt, enter:

`delete accept-rip-route net-number`

Listing Accept RIP Route

To list an accept-rip-route, at the `IP Config>` prompt, enter:

`list rip-routes-accept`

This command displays the set of routes that the RIP routing protocol always accepts. See the IP configuration commands [Enabling Receiving Dynamic Nets on page 4-11](#) and [Enabling Receiving Dynamic Subnets on page 4-12](#) for more information.

Configuring RIP to Override Default Routes

This command configures the conditions under which the router originates a RIP default route, and the cost that will be used when originating the default. To set the originate RIP default, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt enter: set <u>originate-rip-default</u> Always originate default route? [No]: yes Originate default if OSPF routes available? [No]: Originate default of cost [1]?
2	Press Return.

Prompt	Description
Always originate default route? [No]:	With the send default routes flag enabled, Yes sets the router to always advertise a RIP default route whether there is a route in the routing table or not. No enables the following prompt.
Originate default if OSPF routes available? [No]:	With the send default routes flag enabled, Yes sets the router to always advertise a RIP default route when OSPF routes are available. No only advertises a default route if the send default routes flag is enabled.
Originate default of cost [1]?	Selects the metric for the RIP default route. The range is from 0 to 16 with a default of 1.

Configuring RIP to Override Default and Static Routes

Enabling RIP Override Routes

Enabling RIP Override Default

This command enables received RIP information to override the router's default gateway. It is invoked on a per-IP-interface basis. To enable the override default, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable</u> <u>override</u> default <i>gateway-ip-interface-address</i>
2	Press Return. When the enable override default command is invoked, default RIP routes received on the interface with a specified IP interface address overwrite the router's current default gateway, providing the cost of the new default is cheaper.

Example: `IP Config> enable override default 128.185.123.22`

Disabling RIP Override Default

To disable the RIP override default, at the `IP Config>` prompt, enter:

disable override default *gateway- ip-interface-address*

Configuring RIP to Override Default and Static Routes

Enabling RIP Override Static Routes

This command enables received RIP information to override some of the router's statically configured routing information. It is invoked on a per-IP-interface basis. To enable overriding of static routes, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable</u> <u>override</u> <u>static-routes</u> <i>ip-interface-address</i>
2	Press Return. When the enable override static routes command is invoked, RIP routing information received on the interface with a specified IP interface address overwrite statically configured network/subnet routes providing the cost of the RIP information is cheaper.

Example: `IP Config> enable override static-routes 128.185.123.22`

Disabling RIP Override Static Routes

To disable RIP overriding of static routes, at the `IP Config>` prompt, enter:

disable override static-routes *ip-interface-address*

Configuring Receiving RIP, Dynamic Nets/Subnets

Enabling RIP Reception on an Interface

This command modifies the processing of RIP updates that are received on a particular interface. To enable receiving RIP, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable receiving rip</u> ip-interface-address
2	Press Return.

This command is enabled by default.

If you invoke the disable receiving RIP command, no RIP updates are accepted on interface ip-interface-address.

Example: `IP Config> enable receiving rip 128.185.123.22`

Disabling RIP Reception on an Interface

To disable RIP reception, at the `IP Config>` prompt, enter:

disable receiving rip ip-interface-address

Enabling Receiving Dynamic Nets

This command modifies the processing of RIP updates that are received on a particular interface. To enable receiving dynamic nets, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable receiving dynamic net</u> ip-interface-address
2	Press Return.

This command is enabled by default.

If you invoke the disable receiving dynamic nets command, RIP updates received on interface ip-interface-address cannot accept any network-level routes unless they were previously specified in an add accept-rip-route command.

Example: `enable receiving dynamic nets 128.185.123.22`

Configuring Receiving RIP, Dynamic Nets/Subnets

Disabling Receiving Dynamic Nets

To disable receiving dynamic nets, at the `IP Config>` prompt, enter:

disable receiving dynamic net *ip-interface-address*

Enabling Receiving Dynamic Subnets

This command modifies the processing of RIP updates that are received on a particular interface. To enable receiving dynamic subnets, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable</u> <u>receiving</u> <u>dynamic</u> <u>subnets</u> <i>ip-interface-address</i>
2	Press Return.

This command is enabled by default.

Example: `IP Config> enable receiving dynamic subnets 128.185.123.22`

Disabling Receiving Dynamic Subnets

To disable receiving dynamic nets, at the `IP Config>` prompt, enter:

disable receiving dynamic subnet *ip-interface-address*

If you invoke the **disable receiving dynamic subnets** command, RIP updates received on interface *ip-interface-address* cannot accept any subnet-level routes unless they were previously specified in an **add accept-rip-route** command.

Configuring Sending of Routes in RIP

Enabling Sending Default Routes in RIP

This command determines the contents of RIP updates that are sent out a particular interface. To enable sending default routes, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <code>enable sending default-routes ip-interface-address</code>
2	Press Return.

The effect of the enable sending command is cumulative. Each separate enable sending command specifies that a certain set of routes is advertised from a particular interface. A route is included in a RIP update only if it was included by at least one of the enable sending commands. The **enable sending default-routes** command specifies that the default route (if one exists) is included in RIP updates sent out interface *ip-interface-address*.

Example: `IP Config> enable sending default-routes 128.185.123.22`

NOTE

Some settings of the enable sending commands are redundant. For example, if you invoke **enable sending net routes** and **enable sending subnet routes** for a particular interface, there is no need to also specify **enable sending static routes** (because each static route is either a network-level or subnet route). By default, when you first enable RIP, sending net routes and sending subnet routes are enabled for each interface, while sending static routes and sending default are disabled.

Disabling Sending Default Routes in RIP

To disable sending default routes, at the `IP Config>` prompt, enter:

`disable sending default-routes ip-interface-address`

Configuring Sending of Routes in RIP

Enabling Sending Net Routes

This command determines the contents of RIP updates that are sent out a particular interface. To enable sending net routes, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable sending net-routes</u> <i>ip-interface-address</i>
2	Press Return.

The effect of the **enable sending** command is cumulative. Each separate enable sending command specifies that a certain set of routes is advertised from a particular interface. A route is included in an RIP update only if it was included by at least one of the enable sending commands. The enable sending network-routes command specifies that all network-level routes are included in RIP updates sent out interface *ip-interface-address*. A network-level route is a route to a single class A, B, or C IP network.

Example: `IP Config> enable sending net-routes 128.185.123.22`

Disabling Sending Net Routes

To disable sending net routes, at the `IP Config>` prompt, enter:

disable sending net-routes *ip-interface-address*

Enabling Sending Poisoned Reverse Routes

This command determines the contents of RIP updates that are sent out a particular interface. To enable sending poisoned reverse routes, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable sending poisoned-reverse-routes</u> <i>ip-interface-address</i>
2	Press Return.

The effect of the **enable sending** command is cumulative. Each separate enable sending command specifies that a certain set of routes is advertised from a particular interface. A route is included in an RIP update only if it was included by at least one of the enable sending commands. The enable sending poisoned-reverse-routes command specifies that all routes learned on this interface are sent out at a cost of 16. A network-level route is a route to a single class A, B, or C IP network.

Example: `IP Config> enable sending poisoned-reverse-routes 128.185.123.22`

Disabling Sending Poisoned Reverse Routes

To disable sending poisoned-reverse-routes, at the `IP Config>` prompt, enter:

disable sending poisoned-reverse-routes *ip-interface-address*

Enabling Sending Subnet Routes

This command determines the contents of RIP updates that are sent out a particular interface. To enable sending subnet routes, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable</u> sending <u>subnet-routes</u> <i>ip-interface-address</i>
2	Press Return.

The effect of the **enable sending** command is cumulative. Each separate enable sending command specifies that a certain set of routes is advertised through a particular interface. A route is included in a RIP update only if it was included by at least one of the enable sending commands. The enable sending subnet routes command specifies that all subnet routes are included in RIP updates sent out interface *ip-interface-address*. However, a subnet route is included only if *ip-interface-address* connects directly to a subnet of the same IP subnetted network.

Example: `IP Config> enable sending subnet-routes 128.185.123.22`

Disabling Sending Subnet Routes

To disable sending subnet routes, at the `IP Config>` prompt, enter:

disable sending subnet-routes *ip-interface-address*

Configuring Sending of Routes in RIP

Enabling Sending Static Routes

This command determines the contents of RIP updates that are sent out a particular interface. To enable sending static routes, perform the following steps:

Step	Action
1	At the <code>IP Config></code> prompt, enter: <u>enable sending static-routes</u> <i>ip-interface-address</i>
2	Press Return.

The effect of the **enable sending** command is cumulative. Each separate enable sending command specifies that a certain set of routes is advertised through a particular interface. A route is included in a RIP update only if it was included by at least one of the enable sending commands. The enable sending static routes command specifies that all statically configured and directly connected routes are included in RIP updates sent out interface *ip-interface-address*.

Example: `IP Config> enable sending static-routes 128.185.123.22`

Disabling Sending Static Routes

To disable sending static routes, at the `IP Config>` prompt, enter:

disable sending static-routes *ip-interface-address*

Chapter 5

Configuring and Monitoring the OSPF Interface

Overview

Introduction

The Open Shortest Path First (OSPF) protocol is a link state dynamic routing protocol that detects and learns the best routes to (reachable) destinations. OSPF can quickly perceive changes in the topology of an autonomous system, and after a short convergence period, calculate new routes.

Each router running the OSPF protocol has a database describing a map of the routing domain. This database is identical in all participating routers. From this database, the IP routing table is built through the construction of a shortest-path tree, with the router itself as root. The routing domain refers to an autonomous system (AS) running the OSPF protocol, which allows you to split the AS into regions called *areas*. These areas are a collection of contiguous networks, and the topology of any one area is hidden from that of the other areas, significantly reducing routing traffic.

OSPF commands are not dynamic. You must restart the line card before any commands take effect.

In This Chapter

This chapter discusses the following topics:

Topic	Page
Configuring the OSPF Protocol	5-3
Configuring Attached OSPF Areas	5-4
Configuring Routing Interfaces	5-7
Configuring Nonbroadcast Interface Parameters	5-10
Configuring AS Boundary Routing	5-12

Topic	Page
Configuring For Routing Protocol Comparisons	5-13
Setting OSPF Virtual Links	5-14
Enabling OSPF Virtual Links	5-15
Configuring OSPF Router IDs	5-17
Example Configuration Procedure for OSPF	5-18
Listing OSPF Configuration Information	5-21
Monitoring OSPF	5-24
Monitoring OSPF Advertisements	5-25
Monitoring OSPF Areas	5-29
Monitoring AS External Advertisements	5-30
Monitoring OSPF Databases	5-32
Monitoring OSPF Dump Routing Tables	5-34
Monitoring OSPF Interface Statistics and Parameters	5-36
Monitoring OSPF Neighbors	5-38
Monitoring OSPF Router Routes	5-39
Monitoring OSPF Link State Advertisement Size	5-41
Monitoring OSPF Statistics	5-42
Monitoring OSPF Traceroute Addresses	5-45

Configuring the OSPF Protocol

Enabling the OSPF Protocol

OSPF configuration is done through the protocol's own configuration console. The OSPF routing protocol is enabled on an interface-by-interface basis. Each OSPF interface is assigned a cost. Also, an estimate of the OSPF database's size must be given, and the interaction between OSPF and RIP must be defined. Size estimates for the OSPF link state database tells the router software approximately how much memory to reserve for OSPF. Use the following procedures to initially configure OSPF.

To enable OSPF, perform the following steps:

Step	Action
1	At the <code>Config></code> prompt, enter: <u>ospf</u>
2	Press Return. The <code>OSPF Config></code> prompt is displayed.
3	At the <code>OSPF Config></code> prompt, enter: <u>enable ospf routing protocol</u>
4	Enter the total number of AS external routes imported into the OSPF routing domain. Example: <code>Estimated # external routes[0]? 200</code>
5	Enter the total number of OSPF routers in the routing domain. Example: <code>Estimated # OSPF routers [0]? 60</code> <code>OSPF Config></code> The OSPF protocol is enabled.
6	Reboot the line card to enable OSPF.

Once the OSPF protocol is enabled, proceed to [Configuring Attached OSPF Areas on page 5-4](#).

Disabling the OSPF Routing Protocol

To disable the OSPF routing protocol, at the `OSPF Config>` prompt, enter:

disable ospf routing protocol

Reboot the line card to disable OSPF.

Configuring Attached OSPF Areas

Setting OSPF Areas

The next step in the configuration process is setting the parameters that define the OSPF areas that are directly attached to the router. If no areas are defined, the router software assumes that all the router's directly attached networks belong to the backbone area (area ID 0.0.0.0).

To set the parameters for an OSPF area, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt enter: set area
2	Enter the area number. Example: <code>Area number [0.0.0.0]? 1.1.2.2</code>
3	Enter the authentication type. Example: <code>Authentication type [0]? 1</code>
4	Enter whether the area is a stub area. Example: <code>Is this a stub area? (No): y</code>
5	Enter a stub default cost. Example: <code>Stub default cost [0]:</code>
6	Enter import summaries. Example: <code>Import summaries? y</code> <code>OSPF Config></code>

Configuring Attached OSPF Areas

Where:

- **Area number** is the OSPF area ID number, which is a contiguous group of networks defined by a list of address ranges, each indicated by a combination of the IP address and address mask. A network belongs to an area if its address is in the list.
- **Authentication type** (security scheme) to be used in the area. A 1 indicates a simple password; a 0 indicates that no authentication is necessary.
- **Stub area** designation. If you designate YES:
 - Disables external routes from being flooded into the router. The area does not receive any AS external link advertisements, reducing the size of the area's OSPF database and decreasing memory usage for external routers in the stub area.
 - You cannot configure virtual links through a stub area.
 - You cannot configure a router within the stub area as an AS boundary router.
- **Import summaries** (inter-area routes) allows summary routes to be flooded into the router.

External Routing in Stub Areas. You cannot configure the backbone as a stub area. External routing in stub areas is based on a default route. Each border area router attaching to a stub area originates a default route for this purpose. The cost of this default route is also configurable in the OSPF set area command.

Deleting OSPF Areas

To delete an area, at the `OSPF Config>` prompt, enter:

delete area area#

Listing OSPF Areas

To list an area, at the `OSPF Config>` prompt, enter:

list area

Configuring Attached OSPF Areas

Adding Ranges to OSPF Areas

Once you have defined attached OSPF areas, you can add a range of addresses to the area. OSPF areas are defined in terms of address ranges. External to the area, a single route is advertised for each address range. For example, if an OSPF area consists of all subnets of the class B network 128.185.0.0, it is defined as consisting of a single address range. The address range is specified as an address of 128.185.0.0 with a mask of 255.255.0.0. Outside of the area, the entire subnetted network is advertised as a single route to network 128.185.0.0. To add range addresses to defined OSPF areas using the above example, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <u>add range area# ip-address mask</u> Inhibit advertisement? [No]:
2	Press Return.

Example: `OSPF Config> add range 0.0.0.2 128.185.0.0 255.255.0.0 inhibit`

Deleting Ranges from OSPF Areas

To delete a range of areas, at the `OSPF Config>` prompt, enter:

delete range area# ip-address

Configuring Routing Interfaces

Setting OSPF Interfaces

The **set interface** command adds an OSPF interface or changes an existing one. This command can be used only when the interface is disabled. It is used with the **enable interface** command.

When setting OSPF interfaces to routers attached to common network segments, you must enter the same values for the following parameters:

- Hello interval
- Dead router interval
- Authentication key (if an authentication type of 1 [simple password] is used)

To set the OSPF parameters for the router’s interfaces, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: set interface
2	Enter the IP address. Example: Interface IP address [0.0.0.0]? 16.24.11.251
3	Enter the remaining values when prompted. Attaches to area [0.0.0.0]? Retransmission Interval (in seconds) [5]? Transmission Delay (in seconds) [1]? Router Priority [1]? Hello Interval (in seconds) [10]? Dead Router Interval (in seconds) [40]? Type Of Service 0 cost [1]? Authentication Key []? auth_key Retype Auth. Key []? auth_key OSPF Config>

Configuring Routing Interfaces

Deleting OSPF Interfaces

To delete an interface, at the OSPF Config> prompt, enter:

```
delete interface ip-address
```

This command can be used only when the interface is disabled or when dynamic management is disabled.

Listing OSPF Interfaces

To list an interface, at the OSPF Config> prompt, enter:

```
list interface
```

Example:

```
OSPF Config>list interface
```

- - Interface configuration - -								
IP address	Sta	Area	Cost	Rtrns	TrnsDly	Pri	Hello	Dead
16.24.11.251	Ena	1.1.2.2	1	5	1	1	10	40
- - Authentication Keys - -								
IP Address	AuType		Key (Hex/Ascii)					
128.185.138.21			0x617574685F6B6579 "Auth_key"					

Configuring Routing Interfaces

Field	Description
IP address	An IP address is displayed for each interface, together with configured parameters.
Sta	
Area	The OSPF area to which the interface attaches.
Cost	The TOS 0 cost (or metric) associated with the interface.
Rtrns	The retransmission interval, which is the number of seconds between retransmissions of unacknowledged routing information.
TrnsDly	The transmission delay, which is an estimate of the number of seconds it takes to transmit routing information over the interface (it must be greater than 0).
Pri	The interface's router priority, which is used when selecting the designated router.
Hello	The number of seconds between Hello Packets sent out the interface.
Dead	The number of seconds after Hellos cease to be heard that the router is declared down.

Enabling OSPF Interfaces

The **enable interface** command is a dynamic command that activates an OSPF interface and starts sending and receiving packets over it. This command is used with the **set interface** command, and once the interface is set, you can dynamically enable it using the enable command.

To enable an OSPF interface, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <u>enable interface ip-address</u>
2	Press Return. The specified OSPF interface is enabled.

Example: `OSPF Config> enable interface 16.24.11.251`

Disabling OSPF Interfaces

To disable the interface, at the `OSPF Config>` prompt, enter:

disable interface ip-address

Configuring Nonbroadcast Interface Parameters

Setting Nonbroadcast Network Interface Parameters

If the router is connected to a nonbroadcast, multiaccess network, such as an X.25 PDN, you have to configure parameters to help the router discover its OSPF neighbors. This configuration is necessary only if the router is eligible to become the designated router of the nonbroadcast network.

To configure a router for a nonbroadcast network, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <code>set non-broadcast</code>
2	Enter the IP address. Example: <code>Interface IP address [0.0.0.0]? 128.185.138.19</code>
3	Enter the Poll Interval. Example: <code>Poll Interval [120]?</code> <code>OSPF Config></code>

Then configure the IP addresses of all other OSPF routers that are attached to the nonbroadcast network. For each router configured, you must also specify its eligibility to become the designated router.

Deleting Nonbroadcast Network Interface Parameters

To delete a nonbroadcast network interface, at the `OSPF Config>` prompt, enter:

`delete non-broadcast ip-address`

Listing Nonbroadcast Network Interface Parameters

To list a nonbroadcast network description, at the `OSPF Config>` prompt, enter:

`list non-broadcast network description`

This command lists all information related to interfaces connected to nonbroadcast networks. For each nonbroadcast interface, as long as the router is eligible to become the designated router on the attached network, the polling interval is displayed with a list of the router’s neighbors on the nonbroadcast network.

Adding Neighbors to Nonbroadcast Networks

You can add neighbors to nonbroadcast networks. If the router is connected to a nonbroadcast, multiaccess network, such as an X.25 PDN, you have to use this command to help the router discover its OSPF neighbors. This configuration is only necessary if the router is eligible to become the designated router of the nonbroadcast network. Configure the IP addresses of all other OSPF routers that are attached to the nonbroadcast network. For each router configured, you must also specify its eligibility to become designated router. To add neighbors to OSPF areas, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <code>add neighbor</code>
2	Press Return.
3	You will then be prompted for: Interface IP address [0.0.0.0]? 128.185.138.19 IP address of neighbor [0.0.0.0]? 128.185.138.21 Can that router become Designated Router on the net [Yes]?

Deleting Neighbors from Nonbroadcast Networks

To delete a neighbor, at the `OSPF Config>` prompt, enter:

`delete neighbor ip-address ip-address-of-neighbor`

Listing Neighbors from Nonbroadcast Networks

To list a neighbor, at the `OSPF Config>` prompt, enter:

`list neighbor`

This command lists all configured OSPF IP addresses, their configured neighbors, and whether the neighbor is eligible to be a designated router (DR).

Configuring AS Boundary Routing

Enabling AS Boundary Routing

To import routes learned from other protocols (RIP, and statically configured information) into the OSPF domain, enable AS boundary routing. You must do this even if the only route you want to import is the default route (destination 0.0.0.0).

When enabling AS boundary routing, you are asked which external routes you want to import. You can choose to import, or not to import, routes belonging to several categories. Independent of the external categories, you can also configure whether or not to import subnet routes into the OSPF domain. This configuration item defaults to OFF (subnets not imported).

The metric type used in importing routes determines how the imported cost is viewed by the OSPF domain. When comparing two type 2 metrics, only the external cost is considered in picking the best route. When comparing two type 1 metrics, the external and internal costs of the route are combined before making the comparison.

To enable AS boundary, perform the following steps:

Step	Action
1	At the OSPF Config> prompt, enter: <u>enable as boundary</u>
2	Enter the remaining values when prompted. Import RIP routes? [No]: Import static routes? [No]: Import direct routes? [No]: y Import subnet routes? [No]: Always originate default route? [No]: y Originate as type 1 or 2 [2]: Default route cost [1]: Default forwarding address [0.0.0.0]: OSPF Config>

Disabling AS Boundary Routing

To disable as boundary routing, at the OSPF Config> prompt, enter:

disable as boundary routing

Configuring For Routing Protocol Comparisons

If you use a routing protocol in addition to OSPF, or when you change your routing protocol to OSPF, you must set the routing protocol comparison.

OSPF has a 4-level route hierarchy. The **set comparison** command tells the router where the RIP/static routes fit in the OSPF hierarchy. The two lower levels consist of the OSPF internal routes. OSPF intra-area and inter-area routes take precedence over information obtained from any other sources, all of which are located on a single level.

To set the routing protocol comparison, perform the following steps:

Step	Action
1	At the OSPF Config> prompt, enter: set comparison
2	Enter the external comparison type. Example: Compare to type 1 or 2 externals [2]? 1 OSPF Config>

To put the RIP/static routes on the same level as OSPF external type 1 routes, set the comparison to 1. To put the RIP/static routes on the same level as OSPF external type 2 routes, set the comparison to 2. The default setting is 2.

Example: Suppose the comparison is set to 2. In this case, when RIP routes are imported into the OSPF domain, they are imported as type 2 externals. All OSPF external type 1 routes override received RIP routes, regardless of metric. However, if the RIP routes have a smaller cost, the RIP routes override OSPF external type 2 routes.

Configuring OSPF Virtual Links

Setting OSPF Virtual Links

To maintain backbone connectivity, you must have all of your backbone routers interconnected either by permanent or virtual links. Virtual links may be configured between any two area border routers that share a common nonbackbone and nonstub area. Virtual links must be configured in each of the link's two end points.

NOTE

If you are configuring an area border router (ABR) that does not directly attach to the backbone area, you must create a virtual link and an area 0.0.0.0.

The **set virtual-link** command adds an OSPF virtual link interface or changes an existing one. This command is used when the interface is disabled. It is used with the **enable interface** command.

To set a virtual link, perform the following steps:

Step	Action
1	At the OSPF Config> prompt, enter: set virtual-link
2	Enter the remaining values when prompted. Virtual endpt. (Router ID) [0.0.0.0]? 128.185.138.21 Link's transit area [0.0.0.1]? Retransmission Interval (in seconds) [10]? Transmission Delay (in seconds) [5]? Hello Interval (in seconds) [30]? Hello Interval (in seconds) [30]? Dead Router Interval (in seconds) [180]? Authentication Key []? 3-14159 OSPF Config>

Deleting OSPF Virtual Links

To delete a virtual link, at the `OSPF Config>` prompt, enter:

ddelete virtual-link

This command can be used only when the interface is disabled or when dynamic management is disabled.

Listing OSPF Virtual Links

To list a virtual link, at the `OSPF Config>` prompt, enter:

list virtual-link

This command lists all virtual links that were configured with this router as an end point. **Virtual endpoint** indicates the OSPF router ID of the other end point. **Transit area** indicates the nonbackbone area through which the virtual link is configured. Virtual links are considered treated by the OSPF protocol similarly to point-to-point networks. The other parameters listed in the command (`Rtrns`, `TrnsDly`, `Hello` and `Dead`) are maintained for all interfaces.

Enabling OSPF Virtual Links

The enable OSPF virtual-link command is a dynamic command that activates an OSPF interface and starts sending and receiving packets over it. This command is used with the **set virtual-link** command, and once the virtual link is set, you can dynamically enable it using the enable command.

[Figure 5-1](#) illustrates an OSPF routing domain with areas configured with virtual links. Although the backbone area within the domain must be contiguous, you can configure areas that are not physically contiguous using virtual links, as shown.

To enable an OSPF interface, perform the following step:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <u>e</u>nable <u>v</u>irtual-link <i>ip-address</i>

Example: `OSPF Config> enable virtual-link 16.24.11.251`

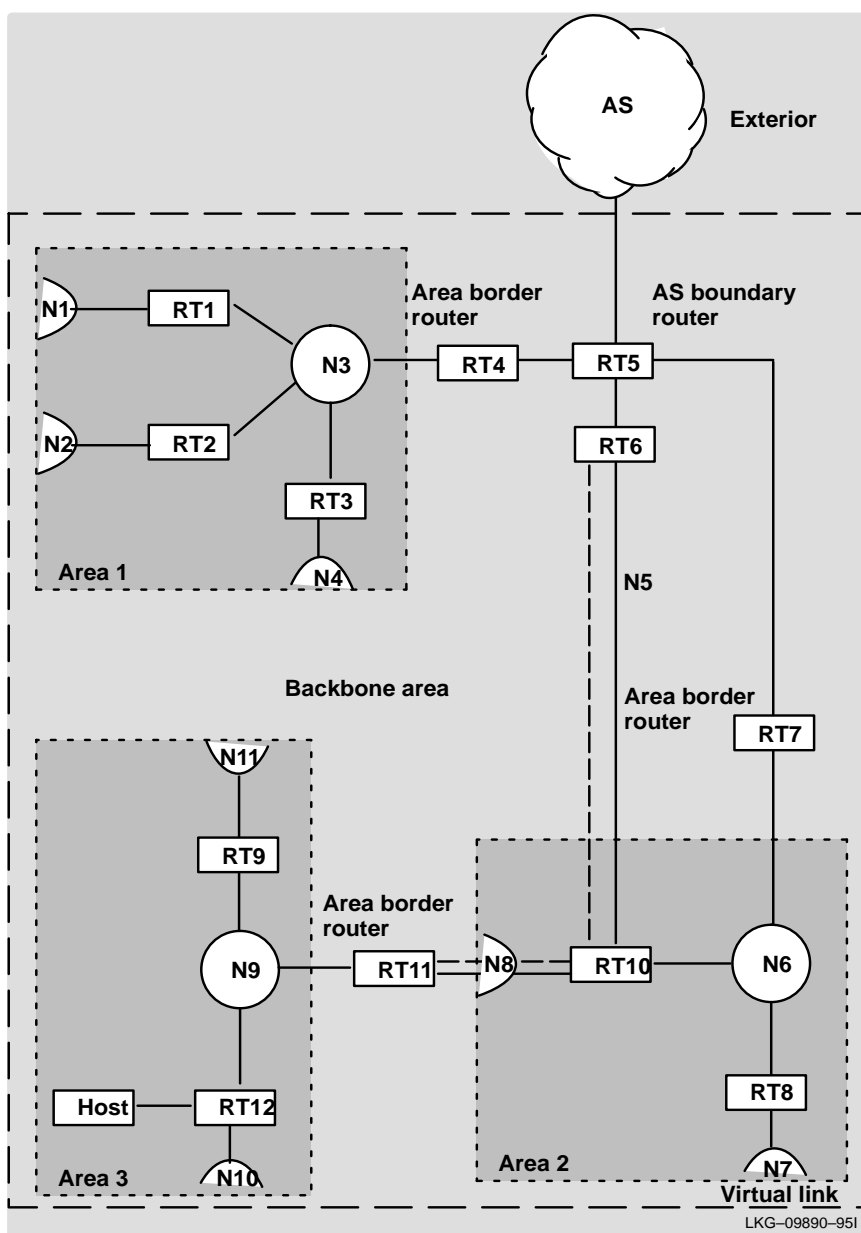

Disabling OSPF Virtual Links

To disable the virtual link, at the `OSPF Config>` prompt, enter:

disable virtual-link *ip-address*

Configuring OSPF Virtual Links

Figure 5-1: OSPF Areas Configured Using Virtual Links

Configuring OSPF Router IDs

Every router in an OSPF routing domain must be assigned a 32-bit router ID. The current OSPF implementation sets the OSPF router ID to be the address of the first OSPF interface appearing in the router's configuration.

The OSPF router ID can also be explicitly set by using the `Config> ip set router id` command. In this case, the router ID must still be one of the router's IP interface addresses.

To set an OSPF router ID using the `set router id` command, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <u>exit</u> The <code>Config></code> prompt appears.
2	At the <code>Config></code> prompt, enter: <u>ip set router-id ip-interface-address</u> Example: set <u>router-id</u> 128.185.138.21
3	To return to OSPF, at the <code>Config></code> prompt, enter: <u>ospf</u>

Example Configuration Procedure for OSPF

The following example demonstrates the configuration of OSPF on a router.

In this example, each parameter that has a default value is given that value. For parameters that have no default (for example, addresses), the procedure uses an arbitrary value.

The following steps summarize the procedure you can use to configure the OSPF protocol on router interfaces. You may have to change the values or parameters given here according to your network setup.

NOTE

You must restart the router for these values to take effect.

Example Configuration Procedure for OSPF

To configure OSPF on the router, perform the following steps:

Step	Action	Configuration Script
1	Enable the OSPF protocol.	Config> ospf Open SPF-Based Routing Protocol configuration console OSPF Config> enable ospf Estimated - external routes [0]? 200 Estimated - OSPF routers [0]? 60
2	Define the attached OSPF areas.	OSPF Config> set area Area number [0.0.0.0]? 1.1.2.2 Authentication Type [0]? 1 Is this a stub area [No]?
3	Set the OSPF interface.	OSPF Config> set interface Interface IP address [0.0.0.0]? 16.24.11.251 Attaches to area [0.0.0.0]? Retransmission Interval (in seconds) [5]? Transmission Delay (in Seconds) [1]? Router Priority [1]? Hello Interval (in seconds) [10]? Dead Router Interval (in seconds) [40]? Type of Service 0 cost [1]? Authentication key []? auth_key Retype Auth. Key []? auth_key
4	Enable the interface.	OSPF Config> enable interface 16.24.11.251
5	Set nonbroadcast interface parameters.	OSPF Config> set non-broadcast Interface IP address [0.0.0.0]? 128.185.138.19 Poll interval [120]?
6	Add a neighbor.	OSPF Config> add neighbor Interface IP Address [0.0.0.0]? 128.185.138.19 IP Address of Neighbor [0.0.0.0]? 128.185.138.21 Can the router become Designated Router on this net [yes]?

Example Configuration Procedure for OSPF

Step	Action	Configuration Script
7	Enable AS boundary routing.	<pre> OSPF Config> enable as boundary Import RIP routes? [No]: Import static routes? [No]: Import direct routes? [No]: yes Import subnet routes? [No]: Always originate default route? [No]: Originate as type 1 or 2 [2]? Default route cost [1]? Default forwarding address [0.0.0.0]? </pre>
8	Configure for routing protocol comparisons.	<pre> OSPF Config> set comparison Compare to type 1 or 2 externals [2]? </pre>
9	Set up virtual links.	<pre> OSPF Config> set virtual Virtual endpoint (Router ID) [0.0.0.0]? 128.185.138.21 Link's transit area [0.0.0.1]? Retransmission Interval (in seconds) [10]? Transmission Delay (in seconds) [5]? Hello Interval (in Seconds) [30]? Dead Router Interval (in seconds) [180]? Authentication Key []? 3-14159 </pre>
10	Set the OSPF router ID.	<pre> OSPF Config> exit Config> ip set router-id 128.185.138.21 </pre>
11	Return to OSPF.	<pre> Config> ospf </pre>

Listing OSPF Configuration Information

Once your router has been configured for OSPF, you can display your router's configuration information by using the **list all** command.

To determine the type of configuration information that can be displayed, perform the following steps:

Step	Action
1	At the <code>OSPF Config></code> prompt, enter: <u>list all</u>
2	Press Return.

Listing OSPF Configuration Information

Example

OSPF Config> **list all**

- - Global Configuration - -

OSPF Protocol:	Enabled
# AS ext. routes:	200
Estimated # routers:	60
External comparison:	Type 2
AS boundary capability:	Enabled
Import external routes:	DIR
Orig. default route:	No (0,0.0.0.0)
Default route cost:	(1 type 2)
Default forward addr:	0.0.0.0

Monitoring OSPF

This section describes tasks you can perform to monitor your router's OSPF protocol.

To access the Monitor process, perform the following steps:

Step	Action
1	At the Main prompt (Main>) enter: <u>m</u>onitor
2	Press Return. The Monitor prompt (Monitor>) is displayed.
3	If the prompt is not displayed, press Return a second time.
4	At the Monitor> prompt, enter: <u>p</u>rotocol <u>o</u>spf The OSPF> prompt is displayed.

From the OSPF> prompt, you can perform specific tasks to determine OSPF parameters, routes, advertisements, database summaries, routing tables, and interface addresses.

Monitoring OSPF Advertisements

You can display the contents of a link state advertisement contained in the OSPF database. For a summary of the router's advertisements, use the **database** command.

To display OSPF advertisements, perform the following steps:

Step	Action
1	At the OSPF> prompt, enter: <i>advertisement ls-type link-state-id advertising-router area-id</i>
2	Press Return. The router's link state advertisements are displayed.

A link state advertisement is defined by its link state type, link state ID, and its advertising router. There is a separate link state database for each OSPF area. Providing an area ID on the command line tells the software which database you want to search. Listed below are different kinds of advertisements that depend on the value given for link state type:

- **Router links** — Contain descriptions of a single router's interface.
- **Network links** — Contain the list of routers attached to a particular interface.
- **Summary nets** — Contain descriptions of a single inter-area route.
- **Summary AS boundary routers** — Contain descriptions of the route to an AS boundary router in another area.
- **AS external nets** — Contain descriptions of a single route.

NOTE

Link state IDs, advertising routers (specified by their router IDs), and area IDs take the same format as IP addresses. For example, the backbone area can be entered as 0.0.0.0.

Monitoring OSPF Advertisements

Example of Router Links Advertisement

The following example shows an expansion of a router links advertisement. The router's ID is 128.185.184.11. It is an AS boundary router and has three interfaces to the backbone area (all of cost 1). Multicast routing was enabled. Detailed field descriptions are provided with the example shown.

This command was also enhanced in two ways. First, when displaying router-LSAs and network-LSAs, the reverse cost of each router-to-router link and router-to-transit-network link is displayed, as well as the previously displayed forward cost. This is done because routing of multicast datagrams whose source lies in different areas/ASs is based on reverse cost instead of forward cost. In those cases where there is no reverse link (which means that the link is never used by the Dijkstra calculation), the reverse cost is shown as 1-way.

In addition, the LSA's OSPF options are displayed in the same manner as they were displayed in the detailed OSPF neighbor command.

New group-membership-LSAs can also be displayed. An example follows. The "LS destination" of each group-membership-LSA is a group address. A router originates a group-membership-LSA for each group that has members on one or more of the router's attached networks. The group-membership-LSA for the group lists those attached transit networks having group members (the type "2" vertices), and when there are members belonging to one or more attached stub networks, or if the router itself is a member of the multicast group, a type "1" vertex whose ID is the router's OSPF router ID is included.

```
OSPF> advertisement 1 128.185.184.11 0.0.0.0
LS age:      173
LS options:  E
LS type:     1

  No. of metrics: 0
  TOS 0 metric:  4 (0)
Link ID:         128.185.184.0
Link Data:       255.255.255.0
Interface type:  3
  No. of metrics: 0
  TOS 0 metric:  1

```

Field	Description
LS age	Indicates the age of the advertisement in seconds. This field is common to all advertisements.
LS options	Indicates the optional OSPF capabilities supported by the piece of the routing domain described by the advertisement, denoted by any combination of: E — processes type 5 externals T — can route based on TOS MC — can forward IP multicast datagrams This field is common to all advertisements.
LS type	Classifies the advertisement and dictates contents: 1 (router links advertisement), 2 (network link advertisement), 3 (summary link advertisement), 4 (summary ASBR advertisement), and 5 (AS external link).
LS destination	Identifies what is being described by the advertisement. Depends on the advertisement type. For router links and ASBR summaries, it is the OSPF router ID. For network links, it is the IP address of the network's designated router. For summary links and AS external links, it is a network/subnet number. For group-membership advertisements, it is a particular multicast group. This field is common to all advertisements.
LS originator	OSPF router ID of the originating router. This field is common to all advertisements.
LS sequence number	Distinguishes separate instances of the same advertisement. A signed 32-bit integer, starting at 0x80000001, and increments by 1 each time the advertisement is updated. This field is common to all advertisements.
LS checksum	A checksum of advertisement contents, used to detect data corruption. This field is common to all advertisements.
LS length	The size of the advertisement in bytes. This field is common to all advertisements.

Monitoring OSPF Advertisements

Router type	Indicates the level of functionality of the router. ASBR is an AS boundary router, ABR is an area border router, and W indicates that the router is a wildcard multicast receiver. This field is used only in router link advertisements.
# Router ifcs	The number of router interface described in the advertisement. This field is used only in router link advertisements.
Link ID	Indicates what the interface connects to. Depends on interface type. For interfaces to routers (point-to-point links), the link ID is the neighbor's router ID. For interfaces to transit networks, it is the IP address of the network designated router. For interfaces to stub networks, it is the network's network/subnet number. Each link in the router advertisement is described by the Link ID, Link Data, and Interface type fields.
Link Data	Indicates 4 bytes of extra information concerning the link. It is either the IP address of the interface (for interfaces to point-to-point networks and transit networks), or the subnet mask (for interfaces to stub networks). Each link in the router advertisement is described by the Link ID, Link Data, and Interface type fields.
Interface type	One of the following: 1 (point-to-point connection to another router), 2 (connection to transit network), 3 (connection to stub network), or 4 (virtual link). Each link in the router advertisement is described by the Link ID, Link Data, and Interface type fields.
No of metrics	The number of nonzero TOS values for the metrics are provided for this interface.
TOS 0 metric	Cost of the interface. The reverse cost of the link is given in parentheses (derived from another advertisement). If there is no reverse link, 1-way is displayed. Each link can also be assigned a separate cost for each IP Type of Service (TOS). This is described by the No. of metrics and TOS 0 metric fields (the router currently does not route based on TOS, and only looks at the TOS 0 cost).

Monitoring OSPF Areas

You can display the statistics and parameters for all OSPF areas attached to the router, by performing the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <u>area</u>
2	Press Return. The router's attached areas are displayed.

Example

In the following example, the router attaches to a single area (the backbone area). A simple password scheme is being used for the area's authentication. The router has three interfaces attaching to the area, and has found four transit networks, seven routers, and no area border routers when doing the SPF tree calculation for the backbone.

OSPF> **area**

Area ID	Authentication	#ifcs	#nets	#rtrs	#brdrs
0.0.0.0	Simple-pass	3	4	7	0

Field	Description
#ifcs	Indicates the number of router interfaces attached to the particular area. These interfaces are not necessarily functional.
#nets	Indicates the number of transit networks that were found while doing the SPF tree calculation for this area.
#rtrs	Indicates the number of routers that were found when doing the SPF tree calculation for this area.
#brdrs	Indicates the number of area border routers that were found when doing the SPF tree calculation for this area.

Monitoring AS External Advertisements

You can display the AS external advertisements belonging to the OSPF routing domain. One line is printed for each advertisement. Each advertisement is defined by the following three parameters: its link state type (always 5 for AS external advertisements), its link state ID (called the LS destination), and the advertising router (called the LS originator).

To display AS external advertisements, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <code>as-external</code>
2	Press Return. The router's AS external advertisements are displayed.

Example

`OSPF> as-external`

Type	LS destination	LS originator	Seqno	Age	Xsum
5	0.0.0.0	128.185.123.22	0x80000084	430	0x41C7
5	128.185.131.0	128.185.123.22	0x80000080	450	0x71DC
5	129.9.0.0	128.185.126.24	0x80000080	676	0x324A
5	134.216.0.0	128.185.123.22	0x80000082	451	0x505A
5	192.26.100.0	128.185.126.24	0x80000080	21	0xDEE8
# advertisements:		133			
Checksum total:		0x43CC41			

Monitoring AS External Advertisements

Field	Description
Type	Always 5 for AS external advertisements.
LS destination	Indicates an IP network/subnet number. These network numbers belong to other autonomous systems.
LS originator	Advertising router.
Seqno, Age, Xsum	It is possible for several instances of an advertisement to be present in the OSPF routing domain at any one time. However, only the most recent instance is kept in the OSPF link state database (and printed by this command). The LS sequence number (Seqno), LS age (Age), and LS checksum fields (Xsum) are compared to see which instance is most recent. The LS age field is expressed in seconds. Its maximum value is 3600.
# advertisements	Indicates the total number of AS external advertisements.
Checksum total	The 32-bit sum (carries discarded) of the individual advertisement's LS checksum fields. This information can be used to quickly determine whether two OSPF routers have synchronized databases.

Monitoring OSPF Databases

You can display a description of the contents of a particular OSPF area’s link state database. AS external advertisements are omitted from the display. A single line is printed for each advertisement. Each advertisement is defined by the following three parameters: its link state type (called Type), its link state ID (called the LS destination), and the advertising router (called the LS originator).

To display a particular database, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <u>database area-id</u>
2	Press Return. The area’s link state database is displayed.

Example

`OSPF> database 0.0.0.0`

Type	LS destination	LS originator	Seqno	Age	Xsum
1	128.185.123.22	128.185.123.22	0x80000084	442	0xCE2D
1	128.185.136.39	128.185.126.39	0x80000082	469	0x5045
2	128.285.125.40	128.185.129.40	0x80000049	457	0xA31
2	128.185.129.40	128.185.129.40	0x80000001	1623	0x12C9
6	224.0.2.6	128.185.184.11	0x80000003	376	0x2250
# advertisements:			14		
Checksum total:			0x4BBC2		

Monitoring OSPF Databases

Field	Description
Type	Separate LS types are numerically displayed: type 1 (router links advertisements), type 2 (network links advertisements), type 3 (network summaries), type 4 (AS boundary router summaries), and type 6 (group-membership-LSAs).
LS destination	Indicates what is being described by the advertisement.
LS originator	Advertising router.
Seqno, Age, Xsum	It is possible for several instances of an advertisement to be present in the OSPF routing domain at any one time. However, only the most recent instance is kept in the OSPF link state database (and printed by this command). The LS sequence number (Seqno), LS age (Age) and LS checksum fields (Xsum) are compared to see which instance is most recent. The LS age field is expressed in seconds. Its maximum value is 3600.
# advertisements	Indicates the total number of advertisements in the area database.
Checksum total	The 32-bit sum (carries discarded) of the individual advertisement's LS checksum fields. This information can be used to quickly determine whether two OSPF routers have synchronized databases.

NOTE

When comparing multicast-capable to nonmulticast routers, the above database checksum (and also # advertisements) will not necessarily match, because nonmulticast routers do not handle or store group-membership LSAs.

Monitoring OSPF Dump Routing Tables

You can display all the routes that were calculated by OSPF and are now present in the routing table. Its output is similar in format to the IP console’s dump routing tables command.

To display the routing tables, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <u>d</u>ump
2	Press Return. The OSPF routing tables are displayed.

Example

`OSPF> dump`

Type	Dest net	Mask	Cost	Age	Next hop (s)
Sbnt	16.0.0.0	FF000000	1	0	None
SPF	16.24.8.0	FFFFFF00	2	2	20.24.12.230
SPF*	20.24.12.0	FFFFFF00	1	1	Eth/1
Sbnt	21.0.0.0	FF000000	1	0	None
Dir*	21.24.166.0	FFFFFF00	1	0	Eth/5

Routing table size: 76 nets (55296 bytes), 5 nets known

Monitoring OSPF Dump Routing Tables

Field	Description
Type	<p>Indicates destination type. Net indicates that the destination is a network. All other destinations are covered by the OSPF routers command.</p> <ul style="list-style-type: none"> • Sbnt — Indicates that the network is subnetted; such an entry is a placeholder only. • Dir — Indicates a directly connected network or subnet. • RIP — Indicates the route was learned through the RIP protocol. • Del — Indicates the route was deleted. • Stat — Indicates a statically configured route. • SPF — Indicates that the route is an OSPF intra-area route. • SPIA — Indicates that it is an OSPF inter-area routes. • SPE1, SPE2 — Indicates OSPF external routes (types 1 and 2 respectively). • Rnge — Indicates a route type that is an active OSPF area address range and is not used in forwarding packets.
Dest net	Destination host or network.
Mast	Displays the entry's subnet mask.
Cost Age	Displays the route cost.
Next hop (s)	Address of the next router on the path toward the destination host. A number in parentheses at the end of the column indicates the number of equal-cost routes to the destination. The first hops belonging to these routes can be displayed with the IP console's route command.

Monitoring OSPF Interface Statistics and Parameters

You can display statistics and parameters related to OSPF interfaces. If no arguments are given, a single line is printed summarizing each interface. If an interface's IP address is given, detailed statistics for that interface are displayed.

To display OSPF interface statistics and parameters, perform the following steps:

Step	Action
1	At the OSPF> prompt, enter: interface or interface ip-address
2	Press Return. The OSPF interface statistics and parameters are displayed.

Example

OSPF> **interface**

Ifc	Address	Phys	assoc. Area	Type	State	#nbrs	#adjs
16.24.8.251	Eth/1		0.0.0.0	Brdcst	64	1	1
16.24.11.251	Eth/1		0.0.0.0	Brdcst	64	1	1
17.1.1.251	Eth/2		0.0.0.0	Brdcst	64	0	0
25.24.13.251	Eth/3		0.0.0.0	Brdcst	64	0	0
18.1.1.251	Eth41		0.0.0.0	Brdcst	64	0	0
16.24.10.251	Eth/0		0.0.0.0	Brdcst	64	0	0
135.24.10.251	Eth/0		0.0.0.0	Brdcst	64	0	0

Ifc	Address	assoc. Area	Type	State	#nbrs	#adjs
128.185.123.22		0.0.0.0	Brdcst	64	0	0
128.185.124.22		0.0.0.0	Brdcst	64	0	0
128.185.125.22		0.0.0.0	Brdcst	64	6	2

Monitoring OSPF Interface Statistics and Parameters

Field	Description
Ifc Address	Interface IP address.
Phys	The physical interface.
Assoc Area	Attached area ID.
Type	Can be either Brdcst (broadcast, for example, an Ethernet interface), P-P (a point-to-point network, for example, a synchronous serial line), Multi (nonbroadcast, multi-access, for example, an X.25 connection), or VLink (an OSPF virtual link).
State	Can be one of the following: 1 (down), 2 (looped back), 4 (waiting), 8 (point-to-point), 16 (DR other), 32 (backup DR), or 64 (designated router).
#nbrs	Number of neighbors. This is the number of routers whose hellos were received, plus those that were configured.
#adjs	Number of adjacencies. This is the number of neighbors in state Exchange or greater. These are the neighbors with whom the router has synchronized or is in the process of synchronization.

Monitoring OSPF Neighbors

You can display statistics and parameters related to OSPF neighbors. If no arguments are given, a single line is printed summarizing each neighbor. If a neighbor's IP address is given, detailed statistics for that neighbor are displayed.

To display OSPF neighbor statistics and parameters, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <code>neighbor</code> or <code>neighbor ip-address</code>
2	Press Return. OSPF neighbor statistics are displayed.

Example

`OSPF> neighbor`

Neighbor addr	Neighbor ID	State	LSrxl	DBsum	LSreq	Ifc
128.185.125.39	128.185.136.39	128	0	0	0	Eth/1

Field	Description
Neighbor addr	Displays the neighbor's address.
Neighbor ID	Displays the neighbor's OSPF router ID.
Neighbor State	Can be one of the following: 1 (Down), 2 (Attempt), 4 (Init), 8 (2-Way), 16 (ExStart), 32 (Exchange), 64 (Loading), or 128 (Full).
LSrxl	Displays the size of the current link state retransmission list for this neighbor.
DBsum	Displays the size of the database summary list waiting to be sent to the neighbor.
LSreq	Displays the number of more recent advertisements that are being requested from the neighbor.
Ifc	Displays the interface shared by the router and the neighbor.

Monitoring OSPF Router Routes

You can display all router routes that were calculated by OSPF and are now present in the routing table. With the `dump routing tables` command, the `Net` field indicates that the destination is a network. The `routers` command covers all other destinations.

To display OSPF router routes, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <code>routers</code>
2	Press Return. OSPF multicast routing statistics are displayed.

Example

`OSPF> routers`

DType	RType	Destination	Area	Cost	Next hop(s)
BR	SPF	20.24.12.230	0.0.0.0	1	20.24.12.230
Fadd	SPF	20.24.12.230	0.0.0.0	1	0.0.0.2
BR	SPF	16.24.8.251	0.0.0.0	2	20.24.12.230
ASBR	SPFA	19.24.9.252	0.0.0.0	3	20.24.12.230

Monitoring OSPF Router Routes

Field	Description
DType	Indicates destination type. <code>Net</code> indicates that the destination is a network, <code>ASBR</code> indicates that the destination is an AS boundary router, and <code>BR</code> indicates that the destination is an area border router, and <code>Fadd</code> indicates a forwarding address (for external routes).
RType	Indicates route type and how the route was derived. <code>SPF</code> indicates that the route is an intra-area route (comes from the Dijkstra calculation); <code>SPIA</code> indicates that it is an inter-area route (comes from considering summary link advertisements).
Destination	Destination router's OSPF ID. For type D entries, one of the router's IP addresses is displayed (which corresponds to a router in another AS).
Area	Always displayed as 0.0.0.0.
Cost	Displays the route cost.
Next hop	Address of the next router on the path toward the destination host. A number in parentheses at the end of the column indicates the number of equal-cost routes to the destination.

Monitoring OSPF Link State Advertisement Size

You can display the number of link state advertisements (LSA) currently in the link state database, categorized by type.

To display the number of LSAs in the database, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <u>size</u>
2	Press Return. OSPF LSAs are displayed.

Example

`OSPF> size`

```
# Router-LSAs:          7
# Network-LSAs:         6
# Summary-LSAs:         14
# Summary Router-LSAs:  2
# AS External-LSAs:     44
# Group-membership-LSAs: 21

# Intra-area routes:    2
# Inter-area routes:    1
# Type 1 external routes 3
# Type 2 external routes 1
```

Monitoring OSPF Statistics

You can display statistics generated by the OSPF routing protocol. The statistics indicate how well the implementation is performing, including its memory and network utilization. Many of the fields displayed are confirmation of the OSPF configuration.

To display OSPF statistics, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <u>s</u>tatistics
2	Press Return. OSPF statistics are displayed.

Example

`OSPF> statistics`

```
S/W version:          2.0
OSPF Router ID:       128.185.184.11
External comparison:  Type 2
AS boundary capability: Yes
Import external routes: EGP RIP STA DIR SUB
Orig. default route:   No (0,0.0.0.0)
Default route cost:    (1, Type 2)
Default forward. addr: 0.0.0.0
```

(continued on next page)

Monitoring OSPF Statistics

Attached areas:	2	Estimated # external routes:	300
Estimated # OSPF routers:	100	Estimated heap usage:	76000
OSPF packets rcvd:	60822	OSPF packets rcvd w/ errs:	28305
Transit nodes allocated:	1728	Transit nodes freed:	1715
LS adv. allocated:	7394	LS adv. freed:	7313
Queue headers alloc:	224	Queue headers avail:	224
# Dijkstra runs:	391	Incremental summ. updates:	0
Incremental VL updates:	0	Buffer alloc failures:	0
Multicast pkts sent:	49487	Unicast pkts sent:	557
LS adv. aged out:	0	LS adv. flushed:	521
Incremental ext. updates:	0		

Field	Description
S/W version	Displays the current OSPF software revision level.
OSPF Router ID	Displays the router's OSPF ID.
External comparison	Displays the external route type used by the router when importing external routes.
AS boundary capability	Displays whether external routes are imported.
Import external routes	Displays which external routes are imported.
Orig default route	Displays whether the router will advertise an OSPF default route. If the value is Yes and a nonzero number is displayed in parentheses, then a default route is advertised only when a route to the network exists.
Default route cost	Displays the cost and type of the default route (if advertised).
Default forward addr	Displays the forwarding address specified in the default route (if advertised).
Attached areas	Indicates the number of areas that the router has active interfaces to.

Monitoring OSPF Statistics

Estimated heap usage	Rough indication of the size of the OSPF link state database (in bytes).
Transit nodes	Allocated to store router links and network links advertisements.
LS adv	Allocated to store summary link and AS external link advertisements.
Queue headers	Form lists of link state advertisements. These lists are used in the flooding and database exchange processes; if the number of queue headers allocated is not equal to the number freed, database synchronization with some neighbor is in progress.
# Dijkstra runs	Indicates how many times the OSPF routing table was calculated from scratch.
Incremental summ updates, Incremental VL updates	Indicate that new summary link advertisements caused the routing table to be partially rebuilt.
Buffer alloc failures	Indicate buffer allocation failures. The OSPF system recovers from temporary lack of packet buffers.
Multicast pkts sent	Covers OSPF hello packets and packets sent during the flooding procedure.
Unicast pkts sent	Covers OSPF packet retransmissions and the database exchange procedure.
LS adv. aged out	Counts the number of advertisements that have hit 60 minutes. Link state advertisements are aged out after 60 minutes. Usually, they are refreshed before this time.
LS adv. flushed	Indicates number of advertisements removed (and not replaced) from the link state database.
Incremental ext. updates	Displays the number of changes to external destinations that are incrementally installed in the routing table.

Monitoring OSPF Traceroute Addresses

You can display the entire OSPF routing path to a given destination, hop by hop using traceroute. Traceroute sends out three probes and prints the IP address of the responder, with the round-trip time associated with the response.

To display OSPF routing paths, perform the following steps:

Step	Action
1	At the <code>OSPF></code> prompt, enter: <code>traceroute ip-destination-address</code>
2	Press Return. The OSPF destination area address and packet size is displayed.

Example

```
OSPF> traceroute 128.185.142.239
TRACEROUTE 128.185.124.110:      56 data bytes
 1  128.185.142.7  16 ms  0  ms  0  ms
 2  128.185.123.22 16 ms  0  ms 16  ms
 3  * * *
 4  * * *
 5  128.185.124.110 16 ms ! 0 ms ! 0 ms
```

Field	Description
Traceroute	Displays the destination area address and the size of the packet being sent to that address.
1	Displays the first trace showing the destination’s NSAP and the amount of time it took the packet to arrive at the destination. The packet is traced three times.
Destination unreachable	Indicates that no route to the destination is available.
3 * * *	Indicates that the router is expecting some form of response from the destination, but the destination is not responding.
4 * * *	

Monitoring OSPF Traceroute Addresses

The traceroute is done whenever the destination is reached, an ICMP Destination Unreachable is received, or the path length reaches 32 router hops.

When a probe receives an unexpected result, several indications can be displayed. They are:

Probe Result	Description
!N	Indicates that an ICMP Destination Unreachable (net unreachable) was received.
!H	Indicates that an ICMP Destination Unreachable (host unreachable) was received.
!P	Indicates that an ICMP Destination Unreachable (protocol unreachable) was received. Since the probe is a UDP packet sent to a strange port, a port unreachable is expected.
!	Indicates that the destination was reached, but the reply sent by the destination was received with a TTL of 1. This usually indicates an error in the destination, prevalent in some versions of UNIX. The destination is inserting the probe's TTL in its replies. This unfortunately leads to a number of lines consisting solely of asterisks before the destination is finally reached.

Chapter 6

Configuring and Monitoring the ARP Interface

Overview

Introduction

The Address Resolution Protocol (ARP) is a low-level protocol that dynamically maps network layer addresses to physical medium access control (MAC) addresses. ARP allows the source host or GIGAswitch GS2000 router to find the MAC address of the destination host on the same network segment, given only the network layer address of the destination system.

For a detailed description of configuring ARP, see the *DIGITAL GIGAswitch GS2000 Line Card Management* guide.

In This Chapter

This chapter discusses the following topics:

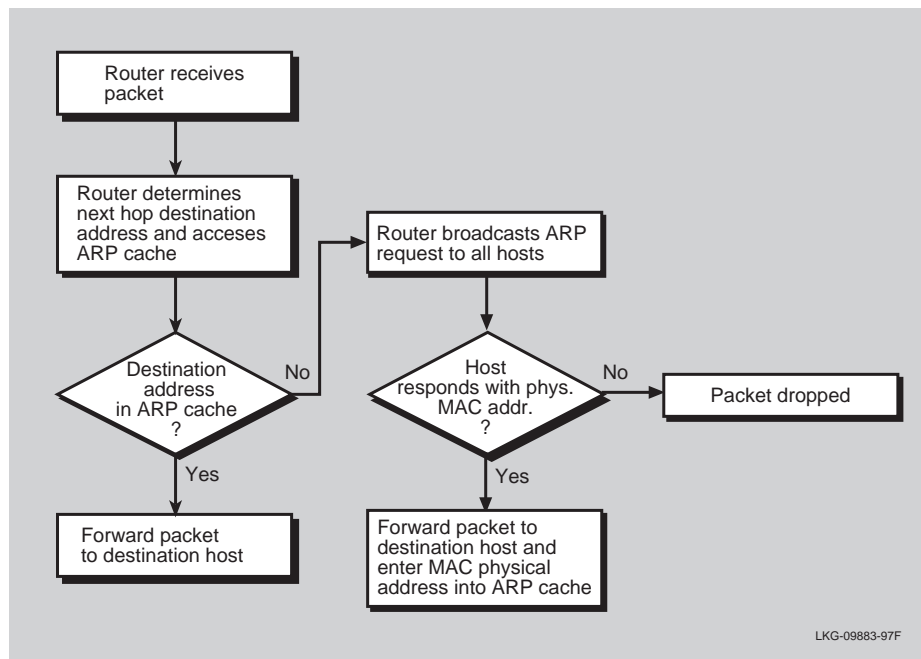

Topic	Page
ARP Address Translation Overview	6-3
Accessing ARP	6-4
Configuring ARP Entries	6-5
Configuring ARP Auto-Refresh	6-6
Listing ARP Configuration Data	6-7
Setting the ARP Refresh Timer	6-8
Monitoring ARP	6-9
Clearing the ARP Cache	6-10
Monitoring the ARP Cache	6-11

Topic	Page
Monitoring ARP Interfaces	6-12
Monitoring ARP Protocols	6-13
Monitoring ARP Statistics	6-14

ARP Address Translation Overview

When a router translates a network layer address to a physical address, first the router accesses the ARP (translation) cache for the physical MAC address that corresponds to that network layer address. If the cache does not contain the physical MAC address, then the router broadcasts an ARP request to all hosts requesting a response from the host with the correct physical MAC address. The destination host with the correct physical MAC address sends a positive response to the router. The router sends the packet to the destination host and enters the physical MAC address into the translation cache for future use. [Figure 6-1](#) illustrates how a router translates a network address to a physical address.

Figure 6-1: ARP Physical MAC Address Broadcast

Accessing ARP

Accessing ARP

To access the ARP configuration commands, perform the following step:

Step	Action
1	At the <code>Config></code> prompt enter: <u>arp</u>
2	Press Return. The <code>ARP Config></code> prompt is displayed.

Configuring ARP Entries

Adding an ARP Entry

ARP cache contains a list of MAC addresses that map to network layer addresses. To add a MAC address translation entry to the ARP cache, perform the following steps:

Step	Action
1	At the <code>ARP Config></code> prompt, enter: <u>a</u>dd <u>e</u>ntry <i>interface-number ip-address mac-addr</i>
2	Press Return. The ARP updates its database with the new data.

Changing an ARP Entry

To change a MAC address translation entry in the ARP cache, at the `ARP Config>` prompt, enter:

change entry *interface-number ip-address mac-addr*

The hardware address parameter (*mac-addr*) is the address of the node being changed.

Deleting an ARP Entry

To delete a MAC address translation entry from the ARP cache, at the `ARP Config>` prompt, enter:

dele~~t~~e entry *interface-number ip-address*

The ARP deletes the entry from its database.

Configuring ARP Auto-Refresh

The auto-refresh function is the router's capability to send an ARP request based on the entry in the translation cache before the entry is deleted due to aging. An entry is deleted when its age reaches the refresh time value. The request is sent directly to the hardware address in the current translation instead of a broadcast. If auto-refresh is enabled, an ARP request is sent in this manner before the refresh timer is allowed to expire.

Enabling ARP Auto-Refresh

To enable ARP auto-refresh, perform the following steps:

Step	Action
1	At the <code>ARP Config></code> prompt, enter: <u>e</u>nable <u>a</u>uto-refresh
2	Press Return.

Disabling Auto-Refresh

To disable ARP auto-refresh, at the `ARP Config>` prompt, enter:

disable auto-refresh

Listing ARP Configuration Data

Listing ARP

The contents of the router's ARP configuration are stored in SRAM. The list command displays the current timeout settings for the refresh timer, whether auto refresh is enabled/disabled and any configure entries.

To list the ARP configuration data, perform the following steps:

Step	Action
1	At the <code>ARP Config></code> prompt, enter: <code>list all</code>
2	Press Return. The ARP's configuration contents are displayed.

Listing ARP Configuration

To list the configuration for the ARP refresh timer and whether auto refresh is enabled/disabled, at the `ARP Config>` prompt, enter:

`list config`

Listing ARP Entries

To list the ARP entries in nonvolatile memory, at the `ARP Config>` prompt, enter:

`list entry`

Setting the ARP Refresh Timer

Setting the ARP refresh timer changes the timeout value used for aging ARP entries. To change the timeout value for the refresh timer, enter the timeout value in minutes. A setting of zero (0) turns off (disables) aging ARP entries.

To set the ARP refresh timer, perform the following steps:

Step	Action
1	At the <code>ARP Config></code> prompt, enter: <code>set refresh-timer timeout-value</code>
2	Press Return. The ARP's refresh time is set.

Monitoring ARP

The following sections describe tasks you can perform to monitor your router's ARP protocol. To access the Monitor process, perform the following steps:

Step	Action
1	At the Main prompt (Main>) enter: <u>m</u>onitor.
2	Press Return. The Monitor prompt (Monitor>) is displayed.
3	If the prompt is not displayed, press Return a second time.
4	At the Monitor> prompt, enter: <u>p</u>rotocol <u>a</u>rp. The ARP> prompt is displayed.

From the ARP Monitor> prompt, you can perform specific tasks to determine ARP statistics, ARP cache, and ARP-configured networks and protocols.

Clearing the ARP Cache

You can flush the ARP cache for a given network interface. The `clear` command can be used to force the deletion of bad translations.

To clear a particular interface, enter the interface number as part of the command. To obtain the interface number, use the `Config> list devices` command.

To clear ARP cache, perform the following steps:

Step	Action
1	At the <code>ARP></code> prompt, enter: <code>clear ifc-#</code>
2	Press Return. The ARP cache for the specified interface is cleared.

Example

```
ARP> clear 15
```

Monitoring the ARP Cache

You can display the ARP cache for a given interface/protocol combination. To display the ARP cache for a particular interface, enter the interface number as part of the command. To obtain the interface number, use the `Config> list devices` command.

If the protocol is other than IP, HST for example, than the protocol number must also be given. This causes the console to display the hardware address to protocol address mappings stored in that database.

To display ARP cache, perform the following steps:

Step	Action
1	At the <code>ARP></code> prompt, enter: <code>dump ifc-# optional-protocol-#</code>
2	Press Return. The ARP cache for the specified interface is displayed.

Example

`ARP> dump 15`

Hardware Address	IP Address	Refresh
02-07-01-00-00-01	192.9.1.2	5

Monitoring ARP Interfaces

You can display the interfaces registered with ARP. The hardware command lists each ARP-registered interface, and displays each interface’s hardware address space (Hardware AS) and local hardware address. Hardware addresses are displayed in hexadecimal.

To display ARP interfaces, perform the following steps:

Step	Action
1	At the <code>ARP></code> prompt, enter: <u>h</u>ardware
2	Press Return. ARP-registered interfaces are displayed.

Example

`ARP> hardware`

Ifc	Interface	Hardware AS	Hardware Address
0			
1	ATM/2	1	02-07-01-00-00-02
.			
.			
.			
15	VLAN/15	1	00-00-F8-00-00-20
16	VLAN/16	1	00-00-F8-00-00-21

Monitoring ARP Protocols

You can display the protocol addresses registered with ARP. This command displays the interfaces, protocol name, protocol number, protocol address space (in hexadecimal), and local protocol addresses.

To display ARP protocol addresses, perform the following steps:

Step	Action
1	At the <code>ARP></code> prompt, enter: <code>protocol</code>
2	Press Return. ARP-registered interfaces and protocol addresses are displayed.

Example

`ARP> protocol`

Interfaces	Protocol	(num)	AS	Protocol Address (es)
15 VLAN/15	IP	(0)	0800	192.9.1.1 18.124.0.11

Monitoring ARP Statistics

You can display a variety of statistics about the operation of the GIGAswitch GS2000 router with ARP enabled.

To display ARP statistics, perform the following steps:

Step	Action
1	At the ARP> prompt, enter: statistics
2	Press Return. ARP statistics are displayed.

Example

ARP> **statistics**

ARP input packet overflows

Ifc	Net	Count
0		0
1	ATM/2	0
.		
.		
.		
15	VLAN/15	0
16	VLAN/16	0

ARP cache meters

Ifc	Prot	Max	Cur	Cnt	Alloc	Refresh:tot	Failure	TMOs:Refresh
0	4	1	1	1	1	0	0	0
1	0	2	2	12	12	0	0	0
2	4	1	1	1	1	0	0	0

Monitoring ARP Statistics

Field	Description
ARP input packet overflow	Displays counters that represent the number of ARP packets discarded on input because the ARP layer was too busy. The counts shown are per interface.
ARP cache meters	Consists of a variety of meters on the operation of the ARP cache. The counts shown are all per protocol, per interface.
Ifc	Displays the interface numbers.
Prot	Displays the protocol numbers.
Max	Displays the all-time maximum length hash chain.
Cur	Displays the current maximum length hash chain.
Cnt	Displays the count of entries currently active.
Alloc	Displays the count of entries created.
Refresh:Tot	Displays the number of refresh requests sent for this network interface and protocol.
Failure	Displays the number of auto-refresh attempt failures due to unavailability of internal resources. This count is not related to whether or not an entry was refreshed.
TMOs:Refresh	Displays the count of entries deleted due to a timeout of the refresh timer.

Chapter 7

Configuring and Monitoring the BGP4 Interface

Overview

Introduction

This chapter describes how to configure and monitor the Border Gateway Protocol (BGP) for a GS2000 logical interface.

BGP is not a routing protocol, but a reachability protocol. In essence, BGP routers selectively collect and advertise reachability information to and from BGP neighbors in their own and other autonomous systems (ASs). Reachability information consists of the sequences of AS numbers that form the paths to particular BGP speakers, and the list of IP addresses that can be reached via each advertised path. An AS is an administrative group of networks and routers that share reachability information using one or more Interior Gateway Protocols (IGPs), such as RIP or OSPF.

BGP commands are not dynamic. You must restart the line card before any commands take effect.

In This Chapter

This chapter discusses the following topics:

Topic	Page
Border Gateway Protocol Overview	7-3
Accessing BGP	7-7
Determining the BGP ID	7-8
Configuring a BGP Speaker	7-9
Configuring Neighbors	7-10

Monitoring Sizes	7-38

Border Gateway Protocol Overview

BGP is an exterior gateway routing protocol used to exchange network reachability information among autonomous systems (ASs). An AS is essentially a collection of routers and end nodes that operate under a single administrative organization. Within each AS, routers and end nodes share routing information using an interior gateway protocol. The interior gateway protocol may be either RIP, OSPF, or Integrated IS-IS.

BGP was introduced in the Internet in the late 1980s to facilitate the loop-free exchange of routing information between autonomous systems. Based on Classless Inter-Domain Routing (CIDR), BGP has since evolved to support the *aggregation* and *reduction* of routing information.

In essence, CIDR is a strategy designed to address the following problems:

- Exhaustion of Class B address space
- Routing table growth

CIDR eliminates the concept of address classes, and provides a method for summarizing n different routes into single routes. This significantly reduces the amount of routing information that BGP routers must store and exchange.

NOTE

Digital Equipment Corporation supports only the latest version of BGP, BGP4, which is defined in RFC 1654. All references to BGP in this chapter and on the interface of DIGITAL routers are to BGP4, and do not apply to previous versions of BGP.

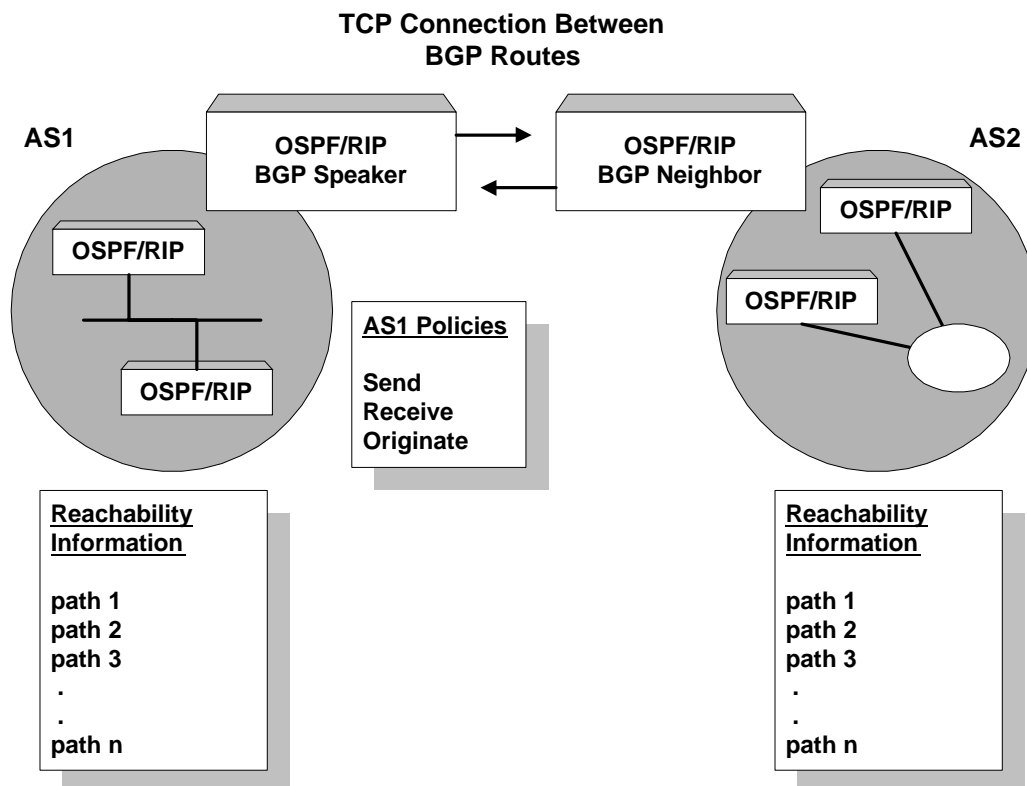

How BGP Works

Routers that run BGP are called *BGP speakers*. These routers function as servers with respect to their BGP neighbors (their clients). Each BGP router opens a passive TCP connection on port 179, and listens for incoming connections from neighbors at this well-known address. The router also opens active TCP connections to enabled BGP neighbors. This TCP connection enables BGP routers to share and update reachability information with neighbors in the same or other ASs. Connections between BGP speakers in the same AS are called *internal BGP (IBGP) connections*, while connections between BGP speakers in different ASs are *external BGP (EBGP) connections*. A single AS may have one or many BGP connections to outside ASs.

Border Gateway Protocol Overview

Figure 7-1 shows two ASs. The BGP speaker in AS1 attempts to establish a TCP connection with its neighbor in AS2. After this connection is established, the routers can share reachability information.

Figure 7-1: BGP Connections Between Two Autonomous Systems

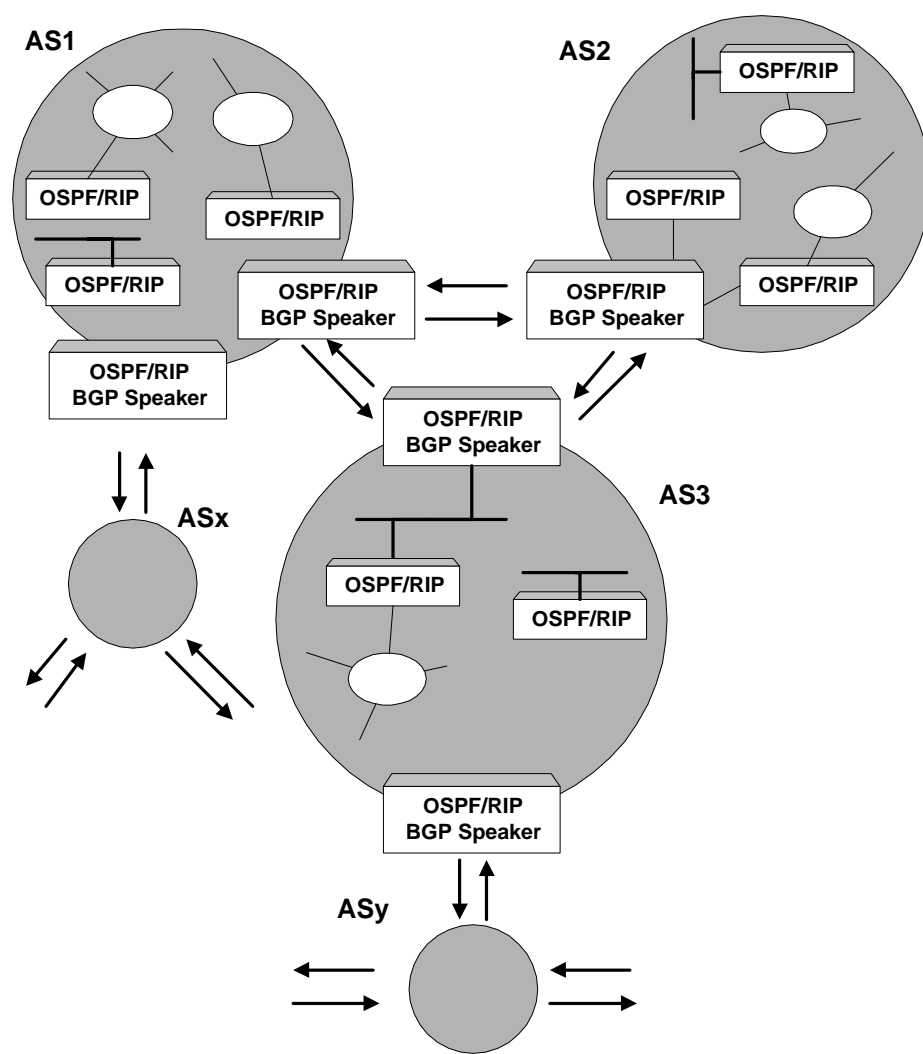

Once the BGP speaker in AS1 establishes a TCP connection with its BGP neighbor in AS2, the two routes can selectively exchange reachability information. The information each router sends or accepts is determined by policies defined for each router.

LKG-10601-97V

While the ASs shown in Figure 7-1 have only one BGP router, each may have multiple connections to other ASs. As an example of this, Figure 7-2 shows three interconnected ASs. AS1 has three BGP connections to outside ASs: one to AS2, one to AS3, and one to ASx. Similarly, AS3 has connections to AS1, AS2 and to ASy.

Figure 7-2: BGP Connections Between Three Autonomous Systems

BGP relationships between three autonomous systems. Note that AS1 and AS3 have two BGP speakers.

LKG-10602-97V

Border Gateway Protocol Overview

Setting Up BGP

Setting up BGP involves four basic steps:

Step	Action
1	Access the BGP Configuration Prompt. Refer to Accessing BGP for details.
2	Configure a BGP speaker. Refer to Configuring a BGP Speaker for details.
3	Configure BGP Neighbors. Refer to Configuring Neighbors for details.
4	Configure Policies. Refer to Configuring Policies for details.

BGP Messages

BGP routers use four kinds of messages to communicate with their neighbors: *open*, *KeepAlive*, *update*, and *notification* messages.

Open Messages

Open messages are the first transmitted when a link to a BGP neighbor comes up and establishes a connection.

KeepAlive Messages

KeepAlive messages are used by BGP routers to inform one another that a particular connection is alive and working.

Update Messages

Update messages contain the interior routing table information. BGP speakers send update messages only when there is a change in their routing tables.

Notification Messages

Notification messages are sent whenever a BGP speaker detects a condition that forces it to terminate an existing connection. These messages are advertised before the connection is transmitted.

Accessing BGP

To access BGP, you must start a console session, access the Main process and then the Configuration process (as described in Chapter 1).

Once you start a console session, the Main process is automatically initiated, and the Main prompt (Main>) is displayed.

To access and configure BGP, perform the following steps:

Step	Action
1	At the Main prompt (Main>), enter: config
2	Press Return. The Config prompt (Config>) is displayed.
3	At the Config> prompt, enter: bgp
4	Press Return. The BGP Config> prompt is displayed.

Determining the BGP ID

BGP requires an ID to exchange network reachability information with its BGP neighbors. However, you do not have to configure a BGP address. BGP uses the first available address from one of the following addresses in the priority listed:

- Router ID
- Router ID selected by OSPF
- Router default IP address

Configuring a BGP Speaker

Enabling a BGP Speaker

Enabling BGP requires you to specify the BGP router's unique AS number. AS numbers are assigned by Stanford Research Institute Network Information Center. To enable a BGP speaker, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: <code>enable bgp speaker as# tcp-segment-size</code>
2	Press Return. BGP is now enabled.

The AS number must be greater than zero, but less than 65536.

The TCP segment size must be greater than zero, but less than 65536. The default value is 1024. This number represents the maximum segment size BGP uses for passive TCP connections.

Example: `BGP Config> enable bgp speaker 165 2048`

Disabling a BGP Speaker

To disable a BGP speaker, at the `BGP Config>` prompt, enter:

`disable bgp speaker`

Configuring Neighbors

BGP neighbors are BGP routers with which a BGP speaker establishes a TCP connection. After enabling a BGP speaker, you must define its neighbors. BGP neighbors can be internal or external. Internal neighbors exist in the same AS, and do not need to have a direct connection to one another. External neighbors exist in different ASs. They must have a direct connection to one another.

Adding Neighbors

To define internal or external BGP neighbors, you must specify the IP address of the neighbor, and assign an AS number to the neighbor. Internal neighbors must have the same AS number as the BGP speaker.

To enable a BGP speaker, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: add neighbor neighbor-ip-address as# init-timer connect-timer hold-timer tcp-segment-size
2	Press Return.

Adding a BGP neighbor automatically enables it, causing the BGP speaker to send out a connection request to the neighbor.

Example: `BGP Config> add neighbor`

```
Neighbor address [0.0.0.0]? 192.0.251.165
AS [0]? 165
Init timer [12]?
Connect timer [120]?
Hold timer [90]?
TCP segment size [1024]?
BGP Config>
```

Configuring Neighbors

Field	Description
Neighbor IP Address	Address of the neighbor you wish to peer with. It may be within your own autonomous system or in another autonomous system. If it is an external neighbor, both BGP speakers must share the same network. There is no such restriction for internal neighbors.
AS#	Your own autonomous system number for internal neighbor or neighbor's autonomous system number.
Init Timer	Specifies the amount of time the BGP speaker waits to initialize resources and reinitiate transport connection with the neighbor in case the speaker has previously transitioned to idle state due to an error. If the error persists, this timer increases exponentially. The default is 12 seconds.
Connect Timer	The amount of time the BGP speaker waits to reinitiate transport connection to its neighbor if the TCP connection fails while in either connect or active state. In the meantime, the BGP speaker continues to listen for any connection that may be initiated by its neighbor. The default is 120 seconds.
Hold Timer	<p>The length of time the BGP speaker waits before assuming that the neighbor is unreachable. Both neighbors exchange the configured information using the open message and choose the smallest of the two timers as their negotiated hold timer value. The default is 90 seconds.</p> <p>Once neighbors have established BGP connection, they exchange KeepAlive messages at frequent intervals to ensure that the connection is still alive and the neighbors are reachable. The KeepAlive timer interval is calculated to be one third of the negotiated hold timer value. Hence, the hold timer value must be either zero or at least three seconds.</p> <p>Note that on switched lines, you may wish to have the hold timer value of zero to save bandwidth by not sending KeepAlive messages at frequent intervals.</p>
TCP Segment Size	The maximum data size that may be exchanged on the TCP connection with a neighbor. This value is used for active TCP connection with the neighbor. It defaults to 1024, but can be set up to 65535.

Configuring Neighbors

Enabling Neighbors

To enable a BGP neighbor, at the `BGP Config>` prompt, enter:

enable neighbor neighbor-ip-address

Example: `BGP Config> enable neighbor 192.0.190.178`

Disabling Neighbors

To disable a BGP neighbor, at the `BGP Config>` prompt, enter:

disable neighbor neighbor-ip-address

Changing Neighbors

To change a BGP neighbor, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: change neighbor neighbor-ip-address as# init-timer connect-timer hold-timer tcp-segment-size
2	Press Return.

The following example changes the value of the hold timer to zero for neighbor 192.0.251.165.

Example: `BGP Config> change neighbor 192.0.251.165`

```
AS [165]?
Init timer [12]?
Connect timer [60]?
Hold timer [12]? 0
TCP segment size [1024]?
```

Deleting Neighbors

To delete a BGP neighbor, at the `BGP Config>` prompt, enter:

delete neighbor neighbor-ip-address

Configuring Policies

The policies you establish determine which routes are imported and exported by the BGP speaker. Decisions about which reachability information to advertise (send) and which to accept (receive) are made on the basis of explicitly defined policy statements. DIGITAL BGP implementation supports three types of policy statements:

- **Originate Policy** — Enables you to select the interior gateway protocol (IGP) networks to export. These policies apply to routes to which the BGP speaker is directly connected; that is, routes that are local to the BGP speaker.
- **Receive Policy** — Enables you to select the route information to import from BGP peers.
- **Send Policy** — Enables you to select the route information to export to peers. Note that exportable route information can include information collected from neighboring ASs, as well as the routes that originate in the IGP.

Once a TCP connection is established, the BGP speaker shown in [Figure 7-2](#) can send its entire routing table to its BGP neighbor in AS2. However, for security or other reasons, it may not be desirable to send reachability information on each network to AS2. Similarly, it may not be desirable for AS2 to receive reachability information on each network in AS1.

NOTE

Before you can send or receive information, you must establish policies.

Configuring Policies

Adding Policies

Adding Originate Policy

This command creates a policy that determines whether a specific address, or range of addresses, can be imported to the BGP speaker’s routing table from the IGP routing table.

To add an originate policy, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: add originate-policy (exclusive/ inclusive) network-prefix network-mask address-match (Exact/Range) tag
2	Press Return.

The following example includes all routes in the BGP speaker’s IGP routing table to be advertised:

```
Example: BGP Config> add originate-policy exclusive
Network Prefix [0.0.0.0]?
Network Mask [0.0.0.0]?
Address Match (Exact/Range) [Exact]? range
Tag [0]?
```

Field	Description
Exclusive	Exclusive policies prevent route information from being included in the BGP speaker’s routing table.
Inclusive	Inclusive policies ensure that specific routes are included in the BGP speaker’s routing table.
Network Prefix	The network prefix for the addresses being affected.
Address Match	The address, or range of addresses, that is affected by the policy statement.
Tag	The value that was set for a particular AS. All tag values match that of the AS from which they were learned.

Adding Receive Policy

This command determines what routes are imported to the BGP speaker's routing table.

To add a receive policy, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: add receive-policy (exclusive/ inclusive) network-prefix network-mask address-match originating-as# adjacent-as# igp-metric (inclusive only)
2	Press Return.

Example: BGP Config> **add receive-policy exclusive**

```
Network Prefix [0.0.0.0]? 10.0.0.0
Network Mask [0.0.0.0]? 255.0.0.0
Address Match (Exact/Range) [Exact]? range
Originating AS# [0]? 168
Adjacent AS# [0]? 165
```

Adding Send Policy

This command creates policies that determine which of the BGP speaker's learned routes are readvertised. These routes may be internal or external to the BGP speaker's AS.

To add a send policy, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: add send-policy (exclusive/ inclusive) network-prefix network-mask address-match tag adjacent-as#
2	Press Return.

Example: BGP Config> **add send-policy exclusive**

```
Network Prefix [0.0.0.0]? 180.220.0.0
Network Mask [0.0.0.0]? 255.255.0.0
Address Match (Exact/Range) [Exact]? range
Tag [0]?
Adjacent AS# [0]? 25
```

Configuring Policies

Changing Policies

Changing Originate Policy

This command alters an existing originate policy definition.

To change an originate policy, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: change originate-policy index# (exclusive/ inclusive) network-prefix network-mask address-match tag
2	Press Return.

The following example alters the BGP speaker's originate policy. Rather than excluding networks with prefix 194.10.16.0 from the IGP routing table, the policy now includes all routes.

Example: BGP Config> **change originate-policy**

```
Enter index of originate-policy to be modified [1]?  
Policy Type (Inclusive/Exclusive) [Exclusive]? inclusive  
Network Prefix [194.10.16.0]? 0.0.0.0  
Network Mask [255.255.240.0]? 0.0.0.0  
Address Match (Exact/Range) [Range]?  
Tag [0]?
```

Changing Receive Policy

This command alters an existing receive policy definition.

To change a receive policy, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: change receive-policy index# (exclusive/inclusive) network-prefix network-mask address-match originating-as# adjacent-as# igp-metric (inclusive only)
2	Press Return.

Configuring Policies

The following example adds a restriction to the BGP speaker's receive policy. Rather than import route information from every BGP peer into its IGP routing table, it now prevents routes from AS 165 from being imported.

Example: BGP Config> **change receive-policy**

```
Enter index of receive-policy to be modified [1]?
Policy Type (Inclusive/Exclusive) [Inclusive]? exclusive
Network Prefix [0.0.0.0]?
Network Mask [0.0.0.0]?
Address Match (Exact/Range) [Range]?
Originating AS# [0]?
Adjacent AS# [0]? 165
```

Changing Send Policy

This command alters an existing send policy to one that is more inclusive or more exclusive.

To change a send policy, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: change send-policy index# (exclusive/ inclusive) network-prefix network-mask address-match tag adjacent-as#
2	Press Return.

The following example adds a restriction to the BGP speaker's send policy. The restriction ensures that all routes in the address range 194.10.16.0 to 194.10.31.255 are excluded when advertising to autonomous system 165.

Example: BGP Config> **change send-policy**

```
Enter index of send-policy to be modified [1]?
Policy Type (Inclusive/Exclusive) [Inclusive]? exclusive
Network Prefix [0.0.0.0]? 194.10.16.0
Network Mask [0.0.0.0]? 255.255.240.0
Address Match (Exact/Range) [Range]?
Tag [0]?
Adjacent AS# [0]? 165
```

Configuring Policies

Deleting Policies

Deleting Originate Policy

This command deletes a specific originate policy. You must specify the index number associated with the policy.

To delete an originate policy, at the `BGP Config>` prompt, enter:

delete originate-policy index#

Example: `BGP Config> delete originate-policy 2`

Deleting Receive Policy

This command deletes a specific receive policy. You must specify the index number associated with the policy.

To delete a receive policy, at the `BGP Config>` prompt, enter:

delete receive-policy index#

Example: `BGP Config> delete receive-policy`

Enter index of receive-policy to be deleted [1]:

Deleting Send Policy

This command deletes a specific send policy. You must specify the index number associated with the policy.

To delete a send policy, at the `BGP Config>` prompt, enter:

delete send-policy index#

Example: `BGP Config> delete send-policy 4`

Sample Policy Definitions

This section provides a set of examples of some specific policies you can set up for a BGP speaker.

Originate Policy Examples

Including All Routes for Advertisement

The following example includes all routes in the BGP speaker's IGP routing table for advertisement. In this sense, you can view this command as the default originate policy statement for BGP.

Notice that the command specifies a range of addresses, rather than a single (exact) address.

Example: BGP Config> **add originate-policy inclusive**

```
Network Prefix [0.0.0.0]?  
Network Mask [0.0.0.0]?  
Address Match (Exact/Range) [Exact]? range  
Tag [0]?
```

Excluding a Range of Routes

The following example excludes all routes in the range 194.10.16.0 to 194.10.31.255 from the BGP routing table, which in turn, prevents them from being advertised. It also specifies a range, but in this case the goal is to prevent the BGP speaker from advertising addresses in this range to its neighbors.

Example: BGP Config> **add originate-policy exclusive**

```
Network Prefix [0.0.0.0]? 194.10.16.0  
Network Mask [0.0.0.0]? 255.255.240.0  
Address Match (Exact/Range) [Exact]? range  
Tag [0]?
```

Sample Policy Definitions

Receive Policy Examples

Importing all Routes from All BGP Neighbors

The following example ensures that the BGP speaker imports all routes from all of its neighbors into its IGP routing table.

Example: BGP Config> **add receive-policy inclusive**

Network Prefix [0.0.0.0]?

Network Mask [0.0.0.0]?

Address Match (Exact/Range) [Exact]? **range**

Originating AS# [0]?

Adjacent AS# [0]?

IGP-metric [0]?

IGP-metric specifies the metric value with which the accepted routes are imported into the speaker's IGP routing table. You are prompted to enter a value for *IGP-metric* only when setting up a policy for route inclusion.

Blocking Specific Routes from a Transit AS

The following example prevents the BGP speaker from importing any routes originating at AS 168 from neighboring AS 165. You might use this command if you do not want the BGP speaker to receive any routes from AS 168 for security reasons.

Example: BGP Config> **add receive-policy exclusive**

Network Prefix [0.0.0.0]?

Network Mask [0.0.0.0]?

Address Match (Exact/Range) [Exact]? **range**

Originating AS# [0]? **168**

Adjacent AS# [0]? **165**

Send Policy Examples

Restricting Route Advertisement to a Specific AS

The following example restricts the BGP speaker. The speaker cannot advertise routes in the address range 143.116.0.0 to 143.116.255.255 that originate from AS 165 to autonomous system 168.

Example: BGP Config> **add send-policy exclusive**
Network Prefix [0.0.0.0]? **143.116.0.0**
Network Mask [0.0.0.0]? **255.255.0.0**
Address Match (Exact/Range) [Exact]? **range**
Tag [0]? **165**
Adjacent AS# [0]? **168**

Advertising All Known Routes

The following example ensures that the BGP speaker advertises all routes originated from its IGP, and all routes learned from its neighboring autonomous systems.

Example: BGP Config> **add send-policy inclusive**
Network Prefix [0.0.0.0]?
Network Mask [0.0.0.0]?
Address Match (Exact/Range) [Exact]? **range**
Tag [0]?
Adjacent AS# [0]?

Configuring Aggregate Addresses

Adding Aggregate Addresses

This command causes the BGP speaker to aggregate a block of addresses and advertise a single route to its BGP neighbors. You must specify the network prefix common to all the routes being aggregated and the prefix mask.

To add an aggregate address, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: add aggregate network-prefix network-mask
2	Press Return.

The following example illustrates how to aggregate a block of addresses from 194.10.16.0 through 194.10.31.255.

Example: `BGP Config> add aggregate`
`Network Prefix [0.0.0.0]? 194.10.16.0`
`Network Mask [0.0.0.0]? 255.255.240.0`

When you add an aggregate definition, remember to define a policy to block the aggregated routes from being exported. If you do not, the router supports both the individual routes and the aggregate you have defined.

Changing Aggregate Addresses

To change an aggregate address, perform the following steps:

Step	Action
1	At the BGP Config> prompt, enter: change aggregate index# network-prefix network-mask
2	Press Return.

The following example changes the current aggregate (aggregate 1). The change causes aggregate 1 to use a different network prefix and mask to aggregate all routes in the address range from 128.185.0.0 to 128.185.255.255.

Example: BGP Config> **change aggregate 1**
Network Prefix [128.185.0.0]? **128.128.0.0**
Network Mask [255.255.0.0]? **255.192.0.0**

Deleting Aggregate Addresses

You must specify the index number of the aggregate you want to delete. The index number is equivalent to the AS number.

To delete an aggregate address, at the BGP Config> prompt, enter:

delete aggregate index#

Example: BGP Config> **delete aggregate 1**

Configuring No Receive Policy for Autonomous Systems

Adding No Receive Policy

This command excludes updates from a particular AS.

To add no receive policy, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: add no-receive as#
2	Press Return.

Example: `BGP Config> add no-receive 178`

Deleting No Receive Policy

This command deletes the no-receive policy set up for a particular AS. You must specify the AS number.

To delete no receive policy, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: delete no-receive as#
2	Press Return.

Example: `BGP Config> delete no-receive 168`

Clearing the BGP Configuration

This command erases the complete BGP configuration.

To erase the complete BGP configuration, perform the following steps:

Step	Action
1	At the <code>BGP Config></code> prompt, enter: clear
2	Press Return.

Listing the BGP Configuration

This command displays various pieces of the IP configuration data, depending on the particular subcommand (**aggregate**, **all**, **bgp speaker**, **neighbor**, **no-receive**, **originate-policy**, **receive-policy** and **send-policy**) you invoke. The following example uses the **all** subcommand to display all the BGP configuration data:

Example: BGP Config> **list all**

```
BGP Protocol:           Enabled
AS:                     167
TCP-Segment Size:      1024
```

Neighbors and their AS:

Address	State	AS	Init Timer	Conn Timer	Hold Timer	TCPSEG Size
128.185.250.168	ENABLED	168	12	60	12	1024
192.0.251.165	ENABLED	165	12	60	12	1024

Receive-Policies:

Index	Type	Prefix	Mask	Match	OrgAS	AdjAS	IGPmetric
1	INCL	0.0.0.0	0.0.0.0	Range	0	0	0

Send-Policies:

Index	Type	Prefix	Mask	Match	Tag	AdjAS
1	INCL	0.0.0.0	0.0.0.0	Range	0	0

Originate-Policies:

Index	Type	Prefix	Mask	Match	Tag
1	EXCL	194.10.16.0	255.255.240.0	Range	0

Aggregation:

Index	Prefix	Mask
1	194.10.16.0	255.255.240.0

AS-PATH with following ASs will be discarded:

AS 178

AS 165

Monitoring BGP

This section describes tasks you can perform to monitor your router's BGP protocol. To access the BGP Monitor process, perform the following steps:

Step	Action
1	At the Main prompt (Main>) enter: <u>monitor</u>
2	Press Return. The Monitor prompt (Monitor>) is displayed.
3	If the prompt is not displayed, press Return a second time.
4	At the Monitor> prompt, enter: <u>bgp</u>
5	Press Return. The BGP> prompt is displayed.

From the BGP> prompt, you can perform specific tasks to determine BGP destinations, neighbors, paths, and sizes.

Monitoring Destinations

This command dumps all BGP routing table entries, or display information on routes advertised to, or received from, specified BGP neighbor addresses (destinations).

Destinations

To display the BGP routing table entries, perform the following steps:

Step	Action
1	At the <code>BGP></code> prompt, enter: destinations
2	Press Return.

Example: `BGP> destinations`

Network	Mask	NextHop	MED	AAG	AGRAS	ORG	AS-Path
128.185.0.0	FFFF0000	192.0.251.165	0	No	0	IGP	
142.4.0.0	FFFF0000	192.0.190.178	0	No	0	IGP	seq[178]
143.116.0.0	FFFF0000	128.185.252.168	0	No	0	IGP	seq[168]
192.0.190.0	FFFFFFF0	192.0.251.165	0	No	0	IGP	
192.0.251.0	FFFFFFF0	192.0.251.165	0	No	0	IGP	
194.10.16.0	FFFFF000	192.0.251.167	0	No	167	IGP	seq[167]

Field	Description
Network	Indicates the IP addresses of the destinations in the routing table.
Mask	The address mask for each entry in the table.
NextHop	Indicates the address of the router to use as the forwarding address towards this destination.
MED	Specifies a multi-exit discriminator value, used to discriminate among multiple entry/exit points to the same AS.
AAG	Indicates whether the route is an aggregate or not. Values are Yes or No.

Monitoring Destinations

Field	Description
AGRAS	The number of the AS that aggregated the route.
ORG	Specifies the originator of this destination: either EGP, IGP, or Incomplete (originated by some other means not known). This field is blank if the <i>Network</i> destination is not being used for forwarding.
AS-PATH	Enumeration of ASs along the path. <ul style="list-style-type: none">• seq: Sequence of ASs in order in the path• set: Set of ASs in the path This field is blank if the <i>Network</i> destination is not being used for forwarding.

Destinations Net Address

This command displays detailed information on the specified route or destination network. The command shows how a specific route was learned, the best path to a specific destination, the metric associated with the route, and other information.

To display specific information on a BGP route, perform the following steps:

Step	Action
1	At the <code>BGP></code> prompt, enter: destinations net-address
2	Press Return.

Example: BGP> destinations 142.4.0.0

```
Network      Mask      NextHop      MED    AAG    AGRAS    ORG    AS-Path
142.4.0.0    FFFF0000   192.0.251.165  0      No     0         IGP    seq[165-178]

Dest:142.4.0.0, Mask:FFFF0000, Age:180, Upd#:13,
LastSent:0001:53:32 Eligible paths: 2
PathID: 8 - (Best Path)
  ASpath: seq[165-178]
  Origin: IGP, Pref: 507, LocalPref: 0
  Metric: 0, Weight: 0, MED: 0
  NextHop: 192.0.251.165, Neighbor: 192.0.251.165
  AtomicAggr: No
```

Monitoring Destinations

```
PathID: 21
  ASpath: seq[168-165-178]
  Origin: IGP, Pref: 505, LocalPref: 0
  Metric: 0, Weight: 0, MED: 0
  NextHop: 128.185.250.168, Neighbor: 128.185.250.168
  AtomicAggr: No
```

Field	Description
Network	Indicates the IP address of the specified destination.
Mask	The address mask for this entry.
NextHop	Indicates the address of the router to use as the forwarding address towards this destination.
MED	Specifies a multi-exit discriminator value, used to discriminate among multiple entry/exit points to the same AS. This field is blank if the <i>Network</i> destination is not being used for forwarding.
AAG	Indicates whether the route is an aggregate or not. Values are Yes or No. This field is blank if the <i>Network</i> destination is not being used for forwarding.
AGRAS	The number of the AS that aggregated the route. This field is blank if the <i>Network</i> destination is not being used for forwarding.
ORG	Specifies the originator of this destination: either EGP, IGP, or Incomplete (originated by some other means not known). This field is blank if the <i>Network</i> destination is not being used for forwarding.
AS-PATH	Enumeration of ASs along the path. <ul style="list-style-type: none">seq: Sequence of ASs in order in the pathset: Set of ASs in the path This field is blank if the <i>Network</i> destination is not being used for forwarding.
Dest	Indicates the IP address of the specified destination.
Mask	The address mask for this entry.
Age	Indicates the age of this entry in seconds.
Upd#	Indicates the sequence number of the last update message for this destination.
LastSent	Indicates the time that the last message was sent to this destination.
Eligible paths	Indicates the number of eligible paths to this destination.

Monitoring Destinations

Field	Description
Path ID	Indicates the unique identifier for each path.
ASpath	Enumeration of ASs along the path. <ul style="list-style-type: none">• seq: Sequence of ASs in order in the path• set: Set of ASs in the path
Origin	Indicates the originator of the destination. This is either EGP, IGP, or Incomplete (originated by some other means not known).
LocalPref	Indicates the originating router's degree of preference for the destination.
Metric	Specifies the path metric with which the route is imported.
Weight	Specifies the path weight.
MED	Specifies a multi-exit discriminator value, used to discriminate among multiple entry/exit points to the same AS.
NextHop	Indicates the address of the router to use as the forwarding address for destinations reachable via the given path.
AtomicAggr	Indicates whether the router advertising the path has included the path in an atomic-aggregate.

Destinations Net Address Net Mask

This command is similar to the **destinations net address** command. This command is useful in cases where multiple network addresses have the same prefix and different masks. In such cases, specifying the network mask narrows the scope of the information presented.

To display specific information on a BGP route, perform the following steps:

Step	Action
1	At the <code>BGP></code> prompt, enter: destinations net-address net-mask
2	Press Return.

Monitoring Destinations

```
Example: BGP> destinations 194.10.16.0 255.255.240.0
Dest:194.10.16.0, Mask:FFFFF000, Age:0, Upd#:3, LastSent:0002:00:00
Eligible paths: 1
PathID: 0 - (Best Path)
  ASpath:
    Origin: IGP, Pref: 0, LocalPref: 0
    Metric: 0, Weight: 0, MED: 0
    NextHop: 194.10.16.167, Neighbor: 194.10.16.167
    AtomicAggr: No, Aggregator AS167/194.10.16.167
```

Destinations Advertised To Net Address

This command lists all routes advertised to the specified BGP neighbor.

To display the list of routes advertised to the specified BGP neighbor, perform the following steps:

Step	Action
1	At the BGP> prompt, enter: destinations advertised-to net-address
2	Press Return.

Example: BGP> destinations advertised-to 192.0.251.165

```
Destinations advertised to BGP neighbor 192.0.251.165
Network      Mask      NextHop      MED   AAG   AGRAS  ORG   AS-Path
194.10.16.0   FFFFF000  194.10.16.167  0     No    167    IGP
192.0.190.0   FFFFFFF00  192.0.251.165  0     No    0      IGP   seq[165]
142.4.0.0     FFFF0000  192.0.251.165  0     No    0      IGP   seq[165-178]
143.116.0.0   FFFF0000  128.185.250.168 0     No    0      IGP   seq[168]
```

Destinations Received From Net Address

This command lists all routes received from the specified BGP neighbor.

To display the list of routes received from the specified BGP neighbor, perform the following steps:

Step	Action
1	At the <code>BGP></code> prompt, enter: destinations received-from net-address
2	Press Return.

Example: `BGP> destinations received-from 128.185.250.167`

Destinations obtained from BGP neighbor 128.185.250.167

Network	Mask	NextHop	MED	AAG	AGRAS	ORG	AS-Path
194.10.16.0	FFFFFF000	128.185.250.167	0	No	167	IGP	seq[167]
192.0.190.0	FFFFFF00	128.185.250.167	0	No	0	IGP	seq[167-165]
142.4.0.0	FFFF0000	128.185.250.167	0	No	0	IGP	seq[167-165-178]

Monitoring Neighbors

This command displays information on all active BGP neighbors.

To display active BGP neighbors, perform the following steps:

Step	Action
1	At the <code>BGP></code> prompt, enter: neighbors
2	Press Return.

Example: `BGP> neighbors`

IP-Address	State	DAY-HH:MM:SS	BGP-ID	AS	Upd#
128.185.252.168	Established	000-00:48:52	128.185.142.168	168	16
192.0.190.178	Established	000-02:01:49	142.4.140.178	178	16
192.0.251.167	Established	000-02:01:45	194.10.16.167	167	16

This command displays detailed data on a particular BGP neighbor.

Monitoring Neighbors

To display information on a particular BGP neighbor, perform the following steps:

Step	Action
1	At the BGP> prompt, enter: neighbor ip-address
2	Press Return.

Example: BGP> neighbor 192.0.251.167

Active Conn:Sprt:1026 Dprt:179 State:Established KeepAlive/Hold Time 4/12

Passve Conn:None

TCP connection errors: 0 TCP state transitions: 0

Monitoring Paths

This command displays the paths stored in the path description database.

To display paths, perform the following steps:

Step	Action
1	At the <code>BGP></code> prompt, enter: paths
2	Press Return.

Example: `BGP> paths`

PathId	NextHop	MED	AAG	AGRAS	RefCnt	ORG	AS-Path
0	10.2.0.3	0	No	0	2	IGP	
4	192.2.0.2	0	No	0	2	IGP	seq[2]
5	192.2.0.2	0	No	2	1	IGP	seq[2]
6	192.2.0.2	0	No	0	1	IGP	seq[2-1]
7	10.2.0.168	0	No	0	4	IGP	
8	192.3.0.1	0	No	0	2	IGP	seq[1]
9	192.2.0.2	0	No	2	1	IGP	seq[2]
10	10.2.0.3	0	No	0	1	IGP	

Monitoring Paths

Field	Description
PathId	Path identifier.
NextHop	Specifies the address of the router to use as the forwarding address for the destinations that can be reached via the given path.
MED	Specifies the multi exit discriminator used to discriminate among multiple entry/exit points to the same AS.
AAG	Indicates whether the path was atomic-aggregated; that is, the router that is advertising the given path has selected a less specific route over the more specific one when presented with overlapping routes.
AGRAS	Indicates the AS number of the BGP speaker that aggregated the routes.
RefCnt	Indicates the number of path entities referring to the descriptor.
ORG	Specifies the originator of the advertised destinations in the given path: either EGP, IGP, or Incomplete (originated by some other means not known).
AS-Path	Enumeration of ASs along the path. <ul style="list-style-type: none">• seq: Sequence of ASs in order in the path• set: Set of ASs in the path

Monitoring Sizes

This command displays the number of entries stored in the various databases.

To display the number of entries in the databases, perform the following steps:

Step	Action
1	At the BGP> prompt, enter: sizes
2	Press Return.

Example: BGP> sizes

```
IP-Address      State      DAY-HH:MM:SS  BGP-ID      AS      Upd#
128.185.252.168 Established 000-00:48:52  128.185.142.168 168    16
192.0.190.178   Established 000-02:01:49  142.4.140.178   178    16
192.0.251.167   Established 000-02:01:45  194.10.16.167   167    16

# Paths: 11
# Path descriptors: 7
Update sequence#: 22
# Routing tbl entries (allocated): 6
# Current tbl entries (not imported): 0
# Current tbl entries (imported to IGP): 3
```

Monitoring Sizes

Field	Description
IP-Address	Specifies the IP address of the BGP neighbor.
State	<p>Specifies the state of the connection. Possible states are:</p> <p>Connect Waiting for the TCP connection to the neighbor to be completed.</p> <p>Active In the event of TCP connection failure, the state is changed to Active, and the attempt to acquire the neighbor continues.</p> <p>OpenSent In this state open message was sent, and BGP waits for an open message from the neighbor.</p> <p>OpenConfirm In this state a KeepAlive message was sent in response to the neighbor's open message, and waits for a KeepAlive notification from the neighbor.</p> <p>Established A BGP connection was successfully established, and can now start to exchange update messages.</p>
BGP-ID	Specifies the neighbor's BGP identification number.
AS	Specifies the neighbor's AS number.
Upd#	Specifies the sequence number of the last update message sent to the neighbor.
# Paths	Total number of eligible paths for all the routes in the BGP routing table.
# Path descriptors	Total number of path descriptors in the database used to hold common path information.
Update sequence#	Indicates the current update sequence number.
# Routing tbl entries (allocated)	Indicates the number of entries in BGP routing table.
# Current tbl entries (not imported)	Indicates the number of BGP routes not imported into IGP.
# Current tbl entries (imported to IGP)	Indicates the number of BGP routes imported into IGP.

Appendix A

DIGITAL Trace Facility

Overview

Introduction

This appendix provides an overview of the DIGITAL trace facility (DTF) version 3.0 and describes what information can be traced over the interfaces in DIGITAL GIGAswitch GS2000 routers having active tracepoints.

In This Appendix

The following topics are covered in this chapter:

Topic	Page
DIGITAL Trace Facility	A-2
Accessing DTF	A-6

DIGITAL Trace Facility

The GIGAswitch GS2000 router supports DIGITAL Trace Facility (DTF) operating in TCP/IP networks. DTF is a host-based utility that traces packets as they pass through the protocol layers within a router and displays the decoded packet on the host or records the trace data in a file for later analysis. DTF includes facilities for:

- Filtering certain packet types at the source
- Filtering the output using regular expressions
- Performing validity check on packets
- Displaying the output in full, brief or raw formats

The GIGAswitch GS2000 performs all packet forwarding and bridging in its fast-path processor (FP), with only terminating and multicast packets sent to the application processor (AP) for processing. There are no DTF tracepoints in the FP which means that forwarded and bridged packets will not be traced. Router and bridge control packets (and all protocol control packets) are either terminating or are multicast and are processed by the AP and are traceable. By removing the forwarded packets from the traced data, you can capture more control packets on any one tracepoint in the GS2000.

The points within a router that can be traced are known as *tracepoints*. Each tracepoint defines a number of *events* (up to 64) and each packet that is traced through the tracepoint is marked with one of these events by the router.

Tracepoints

Tracing occurs through tracepoints that are usually positioned in the transmit and receive routines of the protocol modules in the router. Each tracepoint has a name and state. When a packet passes through an active tracepoint, the packet is copied and queued to the DTF module in the GIGAswitch GS2000, which transmits it to the host where the DTF utility resides.

Each protocol module within the router may have zero or more tracepoints. For example, a tracepoint of *ATM INTERFACE Atm/** traces all ATM interfaces (of LANE or EBT type) whose names match the wildcard string *Atm/**. [Table A-1](#) summarizes the DTF tracepoints for the GIGAswitch GS2000 router.

Table A-1: Router Tracepoints

Tracepoint	Filters	Description
ATM interface <i>name</i>	tx, rx, aarptx, aarprx, apltx, aplrx, arptx, arprx, dntx, dnrx, iptx, iprx, ipxtx, ipxrx, ipv6tx, ipv6rx, moptx, moprxx, ositx, osirx, xnstx, xnsrx	Traces all packets received by the AP on the ATM interface and all packets transmitted over that interface that originated from the router.
FDDI interface <i>name</i>	tx, rx, arptx, aarprx, apltx, aplrx, arptx, arprx, dntx, dnrx, iptx, iprx, ipxtx, ipxrx, ipv6tx, ipv6rx, moptx, moprxx, ositx, osirx, xnstx, xnsrx	Traces all packets received by the AP on the FDDI interface and all packets transmitted over that interface that originated from the router.
VLAN interface <i>name</i>	tx, rx, aarptx, aarprx, apltx, aplrx, arptx, arprx, dntx, dnrx, iptx, iprx, ipxtx, ipxrx, ipv6tx, ipv6rx, moptx, moprxx, ositx, osirx, xnstx, xnsrx	Traces all packets received by the AP on the VLAN interface and all packets transmitted over that interface that originated from the router.
IGMP interface <i>name</i>	tx, rx	Traces all IGMP packets transmitted and received by the IGMP module on the AP over the specified interface.
IP interface <i>name</i>	tx, rx, icmptx, icmprx, ospftx, ospfrx, tcptx, tcprx, udptx, udprx,	Traces all packets transmitted and received by the IP module on the AP over the specified interface. All IP packets received on the AP are traced by this tracepoint, however not all IP packets transmitted by the AP pass through this tracepoint. In particular most IP packets originated by the routing control protocols such as RIP and OSPF are sent directly to the data-link drivers and bypass this tracepoint. Packets originated by the UDP (other than RIP) and TCP based protocols do pass through this tracepoint.
OSPF interface <i>name</i>	tx, rx	Traces all packets transmitted and received by the OSPF module on the AP over the specified interface.
Event subsystem <i>subsystem- list</i>	trace, info, error, always	Traces all the ELS messages. The instance <i>name</i> is a list of ELS subsystems whose messages are traced. By default, all message types are traced and the filters can be used to restrict the trace to messages of a particular type. <u>Note:</u> Wildcards (*) cannot be used with this command.

Events

When DTF initially connects to the router, it optionally instructs the router to filter the packets passing through the specified tracepoint to trace the events that match the events specified in the events list file located on the DTF host system.

When you run DTF on a host system, it uses a transport protocol to connect to the router you want to trace and also sends the parameters to use for the trace session. Events at the activated tracepoints are transmitted back to the host system for analysis (either live display, or recorded in a trace file for later analysis).

Events can be either traced or blocked. By default, all specified events are traced unless otherwise blocked by prefixing the event name with the exclamation point (!) character in the events list file. The special event name, denoted with an asterisk (*), is used to mean all events. If a filter list (event list) is not specified, then DTF assumes all events are traced. If a filter list is specified, then DTF uses the filter list to block the events before processing the list.

Session Trace Buffer Parameters

Session trace buffer parameters are forwarded to the GIGAswitch GS2000 by the host system at the start of the trace session. These parameters determine how much router resources are allocated to the trace session and how much of the data passing through the tracepoints is captured. The following is a list of session parameters sent to the GIGAswitch GS2000:

Parameter	Description
Buffer Count	Specifies the number of trace buffers used to capture trace data during the session. The larger number of trace buffers that are used results in the less trace data lost.
Buffer Size	Specifies the size (in bytes) of the trace buffers. This value determines the size of the data packet that can be traced.
Capture Size	Specifies the number of bytes in the data packet that is copied into the trace buffer.

Trace Data Loss

Trace data loss occurs when there are not enough trace buffers available to trace the next data packet. To minimize the effect of trace data loss, use the following guidelines which are listed in order of effectiveness:

- Use filters to reduce the amount of data being traced.
- Increasing the buffer count allows more trace data to be buffered within the router.
- Reducing the capture size increases the packets that can be contained in each trace buffer.
- Increasing the buffer size increases buffering available to the trace system.
- Record the results instead of displaying them.

Accessing DTF

DTF version 3.0 software is included with the clearVISN Router Configurator software. It is in the install-directory\tools\supported\dtf\ subdirectory.

The latest versions of the DTF documentation and installation kits for each host platform are available over the Internet, and can be downloaded from the following World Wide Web locations:

North America:	http://www.networks.digital.com
Europe:	http://www.networks.europe.digital.com
Asia Pacific:	http://www.networks.digital.com.au

Use the search feature to find the DTF Installation Kit.

Appendix B

Command Line Interface Quick Reference

Overview

Introduction

This appendix lists all the GIGAswitch GS2000 router commands at the command line interface (CLI) level using a command tree format. The following tables list the **Config** and **Monitor** commands:

To Find	Refer To
ARP Config Commands	Table B-1
ARP Monitor Commands	Table B-2
IP Config Commands	Table B-3
IP Monitor Commands	Table B-4
OSPF Config Commands	Table B-5
OSPF Monitor Commands	Table B-6
RIP Config Commands	Table B-7

Table B-1: ARP Config Commands

To Configure ARP	Use These Commands
Auto-Refresh	<u>d</u> isable <u>a</u> uto-refresh <u>e</u> nable <u>a</u> uto-refresh
Entry	<u>a</u> dd <u>e</u> ntry <i>interface number protocol-type ip-address mac-addr</i> <u>c</u> hange <u>e</u> ntry <i>interface number protocol-type ip-address mac-addr</i> <u>d</u> ele t e <u>e</u> ntry <i>interface number ip-address</i> <u>l</u> ist <u>e</u> ntry
List	<u>l</u> ist <u>a</u> ll <u>l</u> ist <u>c</u> onfig
Refresh Timer	<u>s</u> et <u>r</u> efresh-timer <i>timeout value</i>

Table B-2: ARP Monitor Commands

To Monitor ARP	Use These Commands
Clear	<u>c</u> lear <i>ifc #</i>
Dump	<u>d</u> ump <i>ifc # optional protocol #</i>
Hardware	<u>h</u> ardware
Protocol	<u>p</u> rotocol
Statistics	<u>s</u> tatistics

Table B-3: IP Config Commands

To Configure IP	Use These Commands
Access Control	<u>add</u> <u>access-control</u> <i>type ip-source source-mask ip-dest dest-mask first-protocol last-protocol first-port last-port</i> <u>delete</u> <u>access-control</u> <i>record-number</i> <u>list</u> <u>access-controls</u> <u>move</u> <u>access-control</u> <i>from# to#</i> <u>set</u> <u>access-control</u> <u>on</u>
Address	<u>add</u> <u>address</u> <i>interface-number ip-address address-mask</i> <u>change</u> <u>address</u> <i>old ip-address new ip-address new subnet mask</i> <u>delete</u> <u>address</u> <i>ip-address</i> <u>list</u> <u>address</u>
Enable Enhanced Proxy ARP	<u>disable</u> <u>enhanced-proxy-arp</u> <u>enable</u> <u>enhanced-proxy-arp</u> <u>set</u> <u>enhanced-proxy-arp</u> <u>off</u> <u>set</u> <u>enhanced-proxy-arp</u> <u>on</u>
Add Enhanced Proxy ARP	<u>add</u> <u>enhanced-proxy-arp</u> <u>subnet</u> <u>delete</u> <u>enhanced-proxy-arp</u> <u>subnet</u>
BootP Forwarding	<u>disable</u> <u>bootp-forwarding</u> <u>enable</u> <u>bootp-forwarding</u> <u>list</u> <u>bootp</u>
BootP Server	<u>add</u> <u>bootp-server</u> <i>server-ip-address</i> <u>delete</u> <u>bootp-server</u> <i>server-ip-address</i> <u>list</u> <u>bootp</u>
Broadcast Forwarder	<u>add</u> <u>broadcast-forwarder</u> <u>udp</u> <i>udp-port interface number destination ip-address</i> <u>delete</u> <u>broadcast-forwarder</u> <u>udp</u> <i>udp-port interface number destination ip-address</i> <u>disable</u> <u>broadcast-forwarding</u> <u>udp</u> <i>udp-port interface number</i> <u>enable</u> <u>broadcast-forwarding</u> <u>udp</u> <i>udp-port interface number</i> <u>list</u> <u>broadcast-forwarding</u>

To Configure IP	Use These Commands
Cache Size	<u>list</u> <u>sizes</u> set <u>cache-size</u> <i>number</i>
Default Network Gateway	<u>delete</u> <u>default</u> <u>network-gateway</u> set <u>default</u> <u>network-gateway</u> <i>gateway ip-address</i>

Appendix C

GS2000 Counters

Overview

Introduction

This appendix provides an overview of the GS2000 counters and the effect of packets on counters as packets flow through the router.

In This Appendix

The following topics are covered in this chapter:

Topic	Page
Packet Counter Overview	C-2
Router Packet Overview	C-5
Supported Counters	C-6

Packet Counter Overview

The GS2000 contains packet counters that allow you to observe the amount and types of traffic being processed. The counters keep track of sent and received traffic, in categories that indicate how many packets have reached various outcomes (terminated, dropped, bridged, routed, flooded, fragmented, and so on).

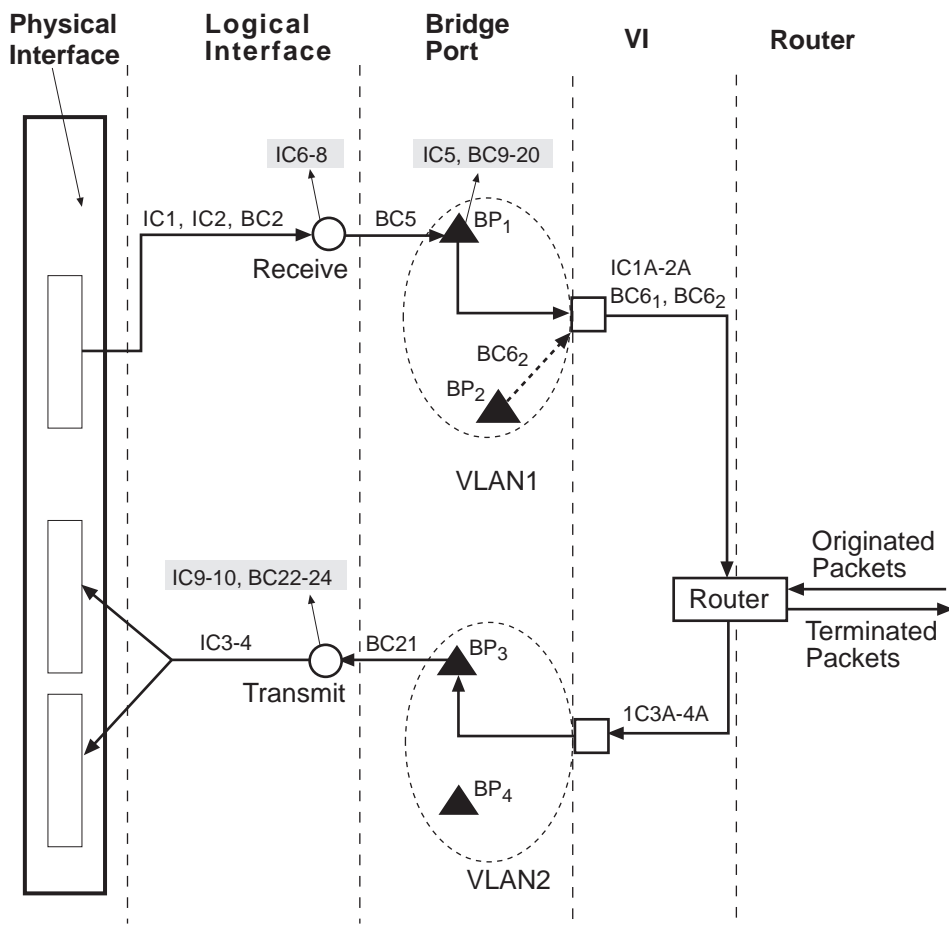

Packet counters exist at four internal layers to help the user trace packets as they flow within the GS2000:

- Logical interfaces
- Bridge ports
- VLAN interfaces
- IP router

When a packet is received by an entity within a layer, the packet is either dropped, processed, or passed on to one or more entities within the next layer. Dropped packets cause an error counter within that layer to increment. In some situations, such as bridge ports and interfaces, entities are tightly coupled and dropped packets can increment error counters in two layers. The effects of the packets are not seen in counters at any layers it does not reach. Packets that are successfully processed at a layer increment non-error counters within that layer. Packets sent to the next layer increment non-error counters in that subsequent layer as well.

[Figure C-1](#) illustrates the four layers and shows the relationships between logical interfaces, bridge ports, VIs, and the IP router. The figure shows which counters are incriminated for a typical path a packet can take within a line card.

Figure C-1: Packet Flow

Packet Counter Overview

Packets arriving at the line card enter the physical interface and can then travel through each of the four layers. Physical interfaces are the connection jacks for cables, and have a one-to-one or one-to-many (in the case of an ATM physical interface) relationship with interfaces. Logical interfaces, shown as circles in [Figure C-1](#), are the lowest layer where counters are used. All packets received and sent are counted by logical interface counters. Error counters for interfaces can catch some basic types of errors appropriate to the level of decoding the packet has undergone at this point (for example, a bad FCS) or other errors that are not necessarily associated with a specific higher-level protocol (for example, buffer overflow). If such an error is detected on an interface, the packet being sent or received is discarded, and the appropriate interface error counter is incriminated. Otherwise, it is passed to a bridge port (where bridging runs on all interfaces).

Packets arriving at a bridge port (dark triangle in [Figure C-1](#)) are first subject to the effects of bridging. They may be dropped for numerous reasons (destination address filtering, STP port state, and so on), each causing a single bridge error or a dropped packet counter to increment for that port. If a packet is not dropped, its destination address determines whether it is unicast to another port, flooded out all ports, terminated, and/or delivered to routing. If the packet is bridged out other ports, the bridge attempts to translate and queue the packet for sending, if necessary. A failure in this process causes a packet to be dropped and the error counter to be incriminated for the received port. A success means that the packet is sent out other ports and counted by them as well. If a received packet is not dropped or sent out by bridging, it is terminated (such as an STP BPDU) and/or submitted to routing.

VLAN interfaces (VIs) receive all packets destined to routing. VIs are paired one-to-one with VLANs, which are groups of bridge ports. VIs submit packets for routing on behalf of any ports within their VLAN. VI receive counters keep track of the total number of packets submitted to routing from their VLAN. Outbound packets sent by routing also go through a VI for transmission on a VLAN. VI transmit counters increment once for each packet sent by routing, although multiple packets may be sent on one or more ports (whose counters are incriminated as well). Packets sent or received on VIs cannot be dropped by the VI. All errors, overflows, and so on, are detected and counted in other layers.

Packets reaching the router may be terminated and are counted by routing. The line card IP counters count transmitted, received, and error packets across all VIs and do not display this information on a per-VI basis.

Router Packet Overview

The GS2000 offers two primary services: bridging and routing. Routing is layered on top of bridging and packets destined for routing are subject to the effects of bridging. For example, routed packets can be dropped due to a user-defined protocol filter on a bridge port and these packets are counted as being received by bridging, but not by routing.

In addition to the packets sent to the router, the router can generate packets to send out. For example, the router is capable of generating a Ping request for another node on the network. In this situation, the Ping packets are counted by IP counters, VI transmit counters, interface transmit counters and bridge port transmit counters.

Packets destined to the router are terminated by the router. You can filter packets by enabling a filter to suppress packets destined to a network or subnet, or by disabling a protocol type. In this situation, only the interface and bridge port receive packet counters are affected.

Supported Counters

This section provides a brief description of interface counters, bridge port counters and the relationship between both counter types.

For a complete definition of interface counters and bridge port counters, refer to the *DIGITAL GIGAswitch GS2000 Line Card Management* manual.

Interface Counters

The following table describes each interface counter (IC) associated with the line card. Interface counters IC1A, IC2A, IC3A and IC4A are identical to IC1, IC2 IC3 and IC4, except the "A" counters represent VI counters.

Interface Counter Number	Interface Counter Name
IC1, IC1A	Unicast packets received
IC2, IC2A	Multicast packets received
IC3, IC3A	Unicast packets transmitted
IC4, IC4A	Multicast packets transmitted
IC5	Input overflow drops
IC6	Input error drops
IC7	Input unknown protocol drops
IC8	Input congestion control drops
IC9	Output overflow drops
IC10	Output error drops

Bridge Port Counters

The following table describes each line card bridge port counter (BC).

Counter Number	Counter Name
BC1	Port restarts
BC2	Total frames received by interface
BC3	IP frames fragmented
BC4	IP frames not fragmented
BC5	Frames submitted to bridging
BC6	Frames submitted to routing
BC7	Frames with unknown destination address
BC8	Frames causing learning transactions
BC9	Source address filter drops
BC10	Destination address filter drops
BC11	Protocol filter drops
BC12	Address rate limiting drops
BC13	Protocol rate limiting drops
BC14	Input buffer overflow drops
BC15	Input queue overflow drops
BC16	Source or destination port blocked drops
BC17	Terminating queue overflows
BC18	Fragmentation queue overflows
BC19	Translate flood queue overflows
BC20	Translation failures
BC21	Frames sent by bridging
BC22	Transmit queue overflows
BC23	Transmit errors
BC24	Too big to send on port drops

Supported Counters

Counter Relationships

Some simple relationships exist between interface counters, bridge port counters, and VI counters. For a given packet in [Figure C-1](#), the following relationships exist. Refer to [Interface Counters on page C-6](#) and [Bridge Port Counters on page C-7](#) for complete lists of the counters.

Receive Relationships

Example 1

The sum of unicast and multicast packets received on an interface is the total of all received packets. It is expressed as:

$$\mathbf{IC1 + IC2 = BC2}$$

(Unicast packets received + Multicast packets received = Total frames received by the interface)

Example 2

Some packets received on an interface may be dropped before being submitted to bridging. It is expressed as:

$$\mathbf{BC2 \geq BC5}$$

(Total frames received by interface \geq Frames submitted to bridging.)

Example 3

Some packets submitted to bridging will be submitted to routing. The rest are either dropped or bridged. It is expressed as:

$$\mathbf{BC5 \geq BC6}$$

(Frames submitted to bridging \geq Frames submitted to routing)

Example 4

The packets submitted to routing by a port's VI may represent only a portion of the packets received by that VI since the VI's VLAN may contain other ports. It is expressed as:

$$\mathbf{BC6 \leq IC1A + IC2A}$$

(Frames submitted to routing \leq Unicast packets received + Multicast packets received)

Transmit Relationships

Example 1

Some packets sent by bridging may be dropped at the interface layer. It is expressed as:

$$\mathbf{IC3 + IC4 \leq BC20}$$

(Unicast packets transmitted + Multicast packets transmitted \leq Translation failures)
