SWXD3-SF 1.05 GB 3.5-Inch Low Profile Disk Drive SBB

Thank you for purchasing our SWXD3-SF StorageWorks Building Block (SBB), designed and manufactured by Digital Equipment Corporation. This 1.05-GB, 3.5-inch low-profile disk drive is compatible with SCSI-2 single-ended interface standards. This drive has been Novell and Microsoft Windows certified and is supported on all Intel compatible Windows, Windows NT and Novell Systems. It is also supported for use with IBM RS/6000, Sun SPARC systems, and HP9000 700/800 Series platforms.

Overview of SWXD3-SF Drive:

This 3.5-inch drive has a formatted capacity of 1.05 GB. It features an average read seek time of 10.4 ms and an average latency of 5.5 ms, providing an average data-read access time of 15.9 ms (without cache). Average write seek time is 11.4 ms, yielding an average data-write access time of 16.9 ms. The drive uses a banded recording technique to maximize storage capacity and obtain media transfer rates as high as 7.1 MB/s. A 512 KB segmented cache buffer maximizes the cache hit rate for sequential reads.

SWXD3-SF Application Notes:

1. The SWXD3-SF 3.5-inch disk drive has been designed to be compatible with many data-storage applications. This SBB is ready to be used when attached to qualified Industry-standard SCSI Adapters and corresponding driver software.

2. The drive identifies itself as drive type DEC RZ26N when interrogated by the SCSI driver software.

3. The SWXD3-SF has a turn-on circuit that automatically spins up the drive after a delay period. The delay period is 12 seconds times the SCSI address of the drive, e.g., drive in SCSI ID2 delays 24 seconds before spin-up; drive in SCSI ID6 delays 72 seconds before spin-up, etc. This arrangement is required for operating systems that do not have a facility for motor spin-up; it lets successive drives in an array automatically spin up following a staggered delay.

StorageW

Product Notes EK-SM2DM-PN. A01

The SWXD3-SF drive also offers high data integrity, ensured by a 96-bit Reed-Solomon error correction code (ECC). ECC is performed "on the fly," when data is written to or read from the disk drive; this scheme will detect and correct a single 41-bit burst or two 17-bit bursts of defective data in a single block on the disk.

Other special features of note include:

- Low profile hard drive technology
- Fast SCSI-2 interface
- Asynchronous and Synchronous data transfer protocol
- Downloadable SCSI firmware
- Programmable sector size reallocation
- Tagged command queuing
- Background queue processing
- Staggered disk spin-up
- Self diagnostics
- Labeled for Sun systems
- 5-year warranty
- UL, CSA, and VDE standards

This sequence avoids excessive loading of the power supply. If your specific operating system is not compatible with this automatic "spin up" feature, please contact your supplier for instructions.

4. Some SCSI adapters provide options in the adapter set-up menu to allow automatic spin-up of the disk drive motor. Although not required by the drive, the automatic spin-up feature may be enabled, if other disk drive devices sharing the same SCSI adapter require it. SCSI adapters that have jumper or switch options to simultaneously spin up disk drive motors should not have that function enabled. The staggered spin-up feature within the SWXD3-SF sequences power to the disk drive motors one at a time. This sequencing avoids out-of-specification surges of power supply current that, under extreme conditions, could cause the supply to turn off.

SWXD3-SF Specifications:

Logical Configuration		
# of discs (platters) ¹	4	
# of read/write heads ²	8	
Servo	Dedicated	
Formatted capacity	1.05 GB	
Number of cylinders	3,117	
Tracks per surface	3,117	
Track capacity (bytes)	43,000	
Bytes/sector	512	
Sectors/drive	2,095,000	

Recording		
Track density	4,200 tpi	
Bit density	61,500 bpi	
Areal density ³	191–200 MB/in ²	
Recording method	RLL (1,7)	

Environmental	
Non-Operating:	
Temperature	-40 ⁰ C to +70 ⁰ C
Humidity (RH)	5% to 95%,
	noncondensing
Operating:	
Temperature	+5 ⁰ C to +55 ⁰ C
Humidity (RH)	8% to 80%,
	noncondensing
Shock	10 G peak half-sine
	11 ms duration
Vibration	22–400 Hz
	@ 0.5 G

¹ The drive contains 3 physical platters.

² The drive contains 5 physical heads.

³ Areal density varies according to disk band.

Drive Status LEDs

Disk drive status is displayed by two LEDs on the front of the storage device (Figure 1). Each LED has three states: *on, off,* and *flashing*. When the drive is powered on, both LEDs flash as a hard-ware/lamp test and then assume the following normal operating status activity:

Performance		
Interface transfer rate:		
Synchronous	10 MB/s	
Asynchronous	5 MB/s	
Media transfer rate	4.23 – 7.09 MB/s	
Cache buffer	512 KB	
Track-to-track seek:	2.1 ms	
Rotational Speed	5411 rpm	
CDD Develop1 Date		

SBB Physical Data	
Height	51 mm/2.0 inches
Width	121 mm/4.8 inches
Length	216 mm/8.5 inches
Weight	0.95 Kg/2.10 lbs

Power Requirements		
Seeking current (Max.)		
+5 Vdc +/-5%	0.85 A	
+12 Vdc +/5%	0.42 A	
Power consumption: (Typical)		
Active	9.0 W	
Idle	6.0 W	

Figure 1 Disk Drive Status LEDs

- The left LED (green) is the device-controlled activity LED and is on or flashing when the drive is active.
- The right LED (amber) is the drive-associated fault LED and indicates an error condition when either on or flashing. This LED is controlled by some adapters or RAID controllers.

Notes for SunOS and Solaris Users

/etc/format.dat information: For your convenience, we have labeled this drive using a format utility that provides the following settings, giving the drive traditional partitions, so you can install this unit and get it up and running quickly. Note that we designated a fixed *nsect* value, even though this banded drive allows a different number of sectors/track, depending on the radius of a given track. We determined this value by dividing the total number of blocks by the total number of heads, dividing that result by the total number of cylinders, and then rounding down the result to the next whole number. Some partition sizes also were selected to be consistent with the *newfs* command. (For example, we reduced the "g" partition to avoid truncation of the last cylinder group.) We recommend that you enter this information into your /etc/format.dat file so that the data will be readily available for any possible future use:

```
disk_type = "DEC_RZ26N" \
  : ctlr = SCSI : fmt_time = 4 \
  : ncyl = 3115 : acyl = 2 : pcyl = 3117 : nhead = 8 : nsect = 82 \
  : rpm = 5400 : bpt = 41984
For SunOS systems, the partition data is as follows:
  partition = "DEC_RZ26N" \
  : disk = "DEC_RZ26N" : ctlr = SCSI \
  : a = 0, 65600 : b = 100, 131200 : c = 0, 2043440 : g = 300, 1846640
For Solaris systems, the partition data is as follows:
  partition = "DEC_RZ26N" \
  : disk = "DEC_RZ26N" : ctlr = SCSI \
  : a = 0, 65600 : b = 100, 131200 : c = 0, 2043440 : g = 300, 1846640
For Solaris systems, the partition data is as follows:
  partition = "DEC_RZ26N" \
  : disk = "DEC_RZ26N" = Ctlr = SCSI \
  : 0 = 0, 65600 : 1 = 100, 131200 : 2 = 0, 2043440 : 6 = 300, 1846640
```

Notes for HP-UX Users

HP-UX Operating System Information

The following required disktab information is provided for users of HP-UX V9 and earlier. Starting with HP-UX V10.0, disktab information is provided for reference only and its use is discouraged by HP. The *newfs* command uses geometry information stored on the disk and therefore no longer requires a disktab entry.

Model HP 9000 Series 700 /etc/disktab Information:

This disk has been formatted and is ready for a file system. For the convenience of HP 9000 Series 700 users, we have provided a few suggested disktab entries, as listed below, that you can use with the *newfs* command. We recommend that you enter this information into your */etc/disktab* file at your earliest convenience so that the data will be readily available for future use.

```
DEC_RZ26N | DEC_RZ26N_noswap:\
    :ty=direct access:ns#82:nt#8:nc#1563:\
    :s0#1025328:b0#8192:f0#1024:\
    :se#512:rm#5400:
DEC_RZ26N | DEC_RZ26N_100MB:\
    :100 MB reserved for swap & boot:ns#82:nt#8:nc#1407:\
    :s0#922992:b0#8192:f0#1024:\
    :se#512:rm#5400:
DEC_RZ26N | DEC_RZ26N_200MB:\
    :200 MB reserved for swap & boot:ns#82:nt#8:nc#1250:\
    :s0#820000:b0#8192:f0#1024:\
    :se#512:rm#5400:
```

Note: If you will be using SAM to add this device (*newfs*) to your system, you must also put the following entry in /usr/sam/lib/C/pd_devinfo.tx:

DISK:::scsi::::DEC RZ26N.*;.*::::::SCSI DEC RZ26N Disk Drive::::::DEC_RZ26N

Model HP 9000 Series 800 /etc/disktab and LVM Information:

We recommend that HP 9000 Series 800 users use the *disksecn* command to create a disktab entry. This must be done before creating partitions or logical volumes. To do this, as superuser, issue the following HP-UX command:

disksecn -dn RZ26N >> /etc/disktab

and supply the following values as answers for the questions asked by the program during the process:

Winchester
1024
82
8
1563
5400

If you wish to use partitions, only segment 2 can work with this drive under the HP-UX operating system. We therefore suggest that you use the Logical Volume Manager (LVM) to allocate disk space in accordance with the sizes of your file systems or raw data instead of a single partition. You can do this from the command line or by using the System Administration Manager (SAM) utility. For more information on LVM, refer to *How HP-UX Works: Concepts for the System Administrator* (B2355-90029), Chapter 9. After creating logical volumes and file systems, you will have more control over the disk than you would have with traditional partitions.

Notes for IBM AIX RS/6000 Users

After you have appropriately connected the drive to the SCSI bus, you can install the SWXD3-SF drive from the root account either by using SMIT, as follows:

Enter: # smit dev

and then perform the following two steps:

- 1. Choose "Configure Devices Added After IPL" from the menu and then exit.
- 2. Execute either of the following selections, as applicable:
 - a: If you want to add the disk to a new volume group, enter **# smit vg**, choose **"Add a Volume Group**" from the menu, and follow normal procedures.
 - b. If you want to add the disk to an already existing volume group, enter # smit lv, choose
 "Add a Logical Volume" from the menu, and follow normal procedures.

As an alternative to using SMIT, you can use the following commands while logged into the root account:

```
1. # cfgmgr
```

```
2. # lsdev -Cc disk
```

Example:

```
# lsdev -Cc disk
hdisk1 Available 00-03-00-20 Other SCSI Disk Drive
```

3. Depending on whether :

a. A new volume group is to be added:

i. # mkvg -f -y<newvg> -s<size> <new_disk>

```
ii. # varyonvg <newvg>
```

or

b. The drive is added to an existing volume group:

#extendvg -f <oldvg> <new_disk>

where the angle-bracketed options are:

<newvg> is the volume group name to be added. <oldvg> is an existing volume group. <size> is the physical partition size (normally 4). <new-disk> is the disk added, as identified by the *lsdev* command.

Notes for MS-DOS, Windows, WindowsNT, and Netware Users

There are no known special operating system-specific instructions regarding the use of this device.

StorageWorks Building Block Identification Labels

Each SBB contains an identification label that shows the SBB device type, capacity, and user specific information. The 8-bit label that appears on the front of the SWXD3-SF is shown below.

- 1. Device type.
- 2. Device capacity.
- 3. The SCSI ID assigned to the device¹.
- 4. The SCSI Logical Unit Number assigned to the device¹.
- 5. The RAID Controller Number assigned to the device¹.
- 6. The device bus width. For the SWXD3-SF, this value is N.
- 7. Indicates the type of shelf in which the drive can function.
 - N the device is 8-bit shelf compatible.
 - W The device is 16-bit compatible.
 - N/W The device is compatible with either shelf.
- 8. The data transfer rate in MB per second.

¹ These values are determined by the user.
